PIRATES! CHASE FAME & FORTUNE ON THE HIGH SEAS

The Action Adventure Simulation

Pirates! The world's first swashbuckling simulation.

Non-stop action and historical drama take place on the Spanish Main during the 17th century and you play the leading role – Privateer Captain, a pirate in all but name.

Leap into this era of turbulence and change – a time when daring adventurers can gain power and wealth.

Raid treasure-laden galleons and plunder rich ports. Learn to navigate, to fence and to avoid mutiny.

Uniquely, Pirates! combines the excitement of an adventure story with the challenge of simulation decision-making. You must choose the most lucrative expeditions, forge the most fruitful alliances and

negotiate the greatest profits.

Success will determine your status in later life. How will you end your days? A prosperous noble or common scoundrel?

Pirates! will be landing in all good software stores soon.

DATA STATEMENTS

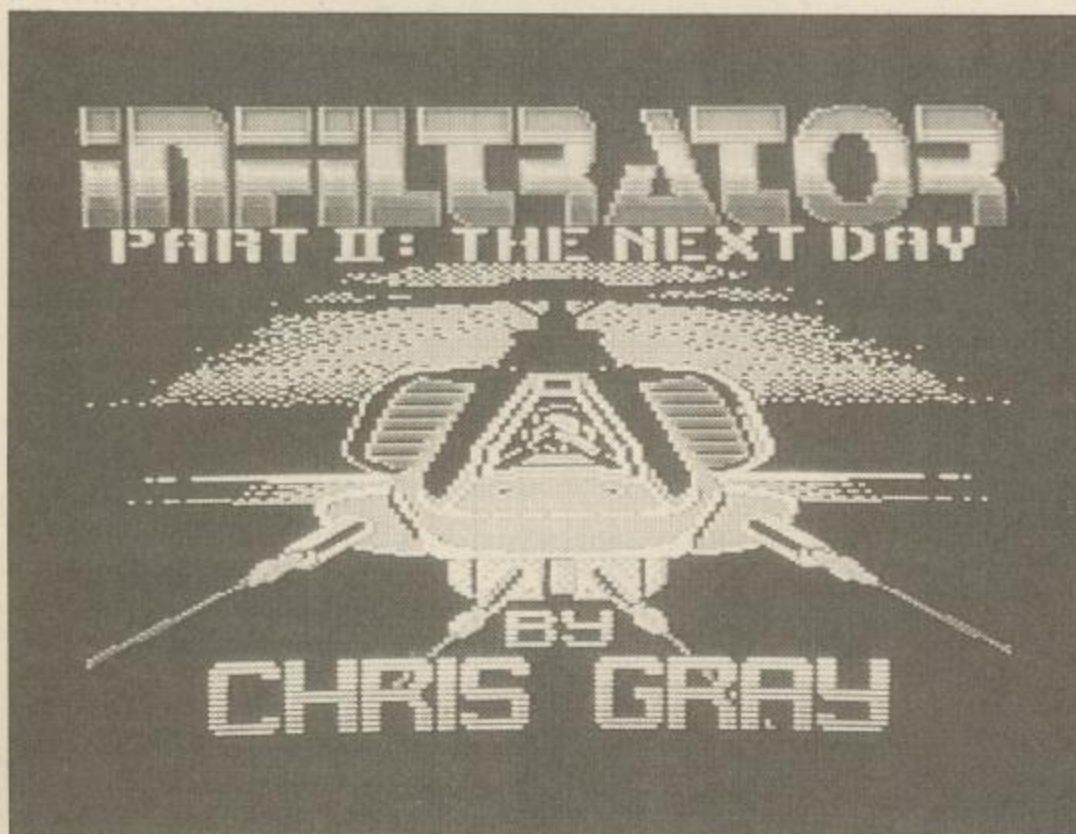

Prepare for the Cold with U.S. Gold

Dare I say it, but Christmas is not far away and U.S. Gold have come up with an impressive preview list once again.

Charlie Chaplin enables you to become a silent movie director and produce the world's greatest slapstick comedian in an epic production. Choose your script, get your props together and you're ready for ACTION. A scene comprises of an adventure, and if you like it, you can go onto the next scene. The real test however is the audience reaction to the final version, which in the long run will govern your earnings – so it better be good! Available on the C64.

Following the success of *Infiltrator*, *Infiltrator II – The Next Day* is new in the pipeline. Jimbo-Baby embarks on three entirely new missions to save the world from the clutches of Mad Leader. The missions include neutralising a deadly nerve gas compound, deactivation of the enemy's supply of dastardly neutron bombs and a final desperate confrontation with the Mad Leader himself.

Infiltrator II and Gauntlet II coming soon

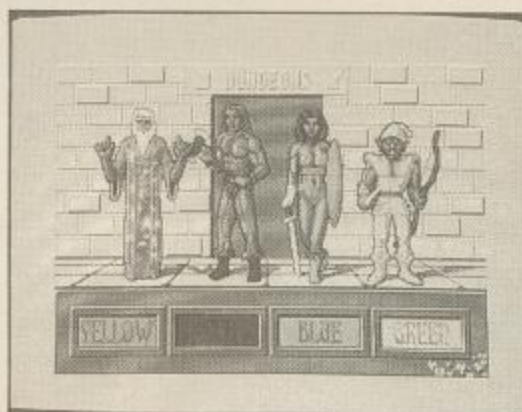

Infiltrator II will be available on C64 priced at £4.99 (ca) and £9.99 (disk) or including *Infiltrator I* for £9.99 (ca) and £14.99 (disk).

For all you *Gauntlet* fans, prepare yourself for *Gauntlet II*. Choose your original *Gauntlet* character and come up against new creatures such as the fire-breathing dragon and the IT creature.

Fight you way through the complex mazes, keeping an eye out for stun tiles and acid puddles! Do not despair, *Gauntlet II* does have some new features to help you with your crusade!

Gauntlet II will be available for the C64.

Other releases being prepared for the Christmas period are *Rygar*,

Indiana Jones, *720°* and *Outrun*. It looks as if a good Christmas will be had by all!

Touchline:

U.S. Gold Ltd Unit 2/3 Holford Way, Holford, Birmingham B6 7AX. Tel: 021-356 3388.

Budget Bonanza

Following the success of the Silver budget range, Firebird are releasing a new budget label. Priced at £2.99, this range will be aimed at the user who is looking for a slightly more up-market product but which is still good value.

The blobpods are back in *Hyber Blob* on the C64. Help the blobpods across fragile areas of blocks – but beware, as the blocks can break or burn the blobpods feet, and whatever you do – don't let them fall through the gaps!

Vbiks Music is a polyphonic sequencer which draws all the best features from the C64 SID processor. Access all waveform modulation features on the three inbuilt channels and the fourth channel will allow you to include digitised sounds.

Touchline:

Firebird Software: First Floor, 64-67 New Oxford Street, London WC1A 1PS. Tel: 01-379 6755.

Rack-It is the new budget range from Hewson with games ranging from mind-taxing puzzlers to arm-aching shoot-em-ups. The games will sell for £2.99 with an overall theme of black and white, with great graphics.

Draughts Genius will appeal to those seeking an intellectual challenge, and adventures such as *Rex Horde* and *Herobotix* for the middle of the road players. Last but not least, *Powerama* and *Anarchy* will appeal to all those who enjoy a good shoot-em-up!

The games will be available on the C64 and will be priced at £2.99 each.

Hewson: 56b Milton Trading Estate, Milton, Abingdon, Oxon OX14 4RX. Tel: 0235 832939.

Commodore's latest signings

Shooting for the Top

Commodore UK Ltd's advertising strategy is underway with the co-operation of a few lads – the Chelsea Football team to be precise! Yes – for the next three years the team will sport(!) the revamped shirts bearing the Commodore logo, which will also be displayed around the home ground perimeter boards.

The biggest deal in British football to date was finalised with the presentation of a cheque for £1,250,000 to the Chelsea Football club.

Commodore and Chelsea respectively are aiming for the top and both feel they can climb the ladder to

success together. There's more than the 'C's and their colours which bind them together. As well as the advertising, Commodore dealers will be able to take advantage to the tie-up through various promotional options.

Commodore have a history of sporting links following their German sponsorship of Bayern Munich and Dynamo Kiev and the backing of the first professional cycling tour of Britain.

Touchline:
Commodore Business Machines (UK) Ltd: Commodore House, The Switchback, Gardner Road, Maidenhead, Berks SL6 7XA. Tel: 0628 770088.

Join the Club

The only requirement for free membership to the Cheetah Club is to own one of Cheetah's products. All members can then keep up to date with regular news bulletins, special offers and product discounts. If you own a product simply write to the following address for an application form.

Cheetah Marketing Ltd: Norbury House, Norbury Road, Fairwater, Cardiff CF5 3AS. Tel: 0222 555525.

Beat the Brains

Ever dreamed of reconstructing your IQ – well, now is your chance in *Pir²* – a recent release from Mind Games. The problems arise when you play the part of Professor Storm – the Geometric Genius, and suddenly you discover you haven't a single mathematical formula in your brain! Work your way around the cogs and wheels that connect the memory bubbles containing the formula you need. Can you prevent the good professor from becoming a moron – there's only one way to find out! Available on the C64, priced at £8.95 (ca) and £12.95 (disk).

Touchline:

Mind Games (ASP Software Group), Victory House, Leicester Place, London WC2H 7NB. Tel: 01-439 0666.

Software for HMV

A games software department is to be opened in HMV Music Stores aiming to hold the largest range of software in Oxford Street, London.

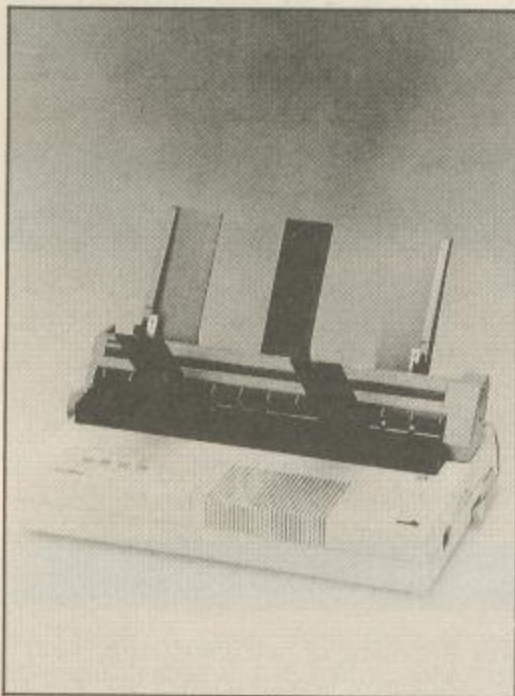

Andrew Tait, HMV's software expert comments, 'we will be mass merchandising all new releases with discounts on selected new titles. As well as this our customers can look forward to great in-store promotions and competitions'.

So, when you're browsing for your latest LP's at 363 Oxford Street, remember you can get your computer software there as well.

Brother 1724

The latest on the Hardware Front

Robtek has recently acquired the rights to the Terminator joystick from the Denmark based company Supersoft. Robtek will be covering the UK and Germany, and sales director, Mike Segrue commented, 'we are looking to achieve very high sales on what is an excellent and very novel product. The Terminator costs £19.95

In a bid to produce quality disks at low prices, Mydisk Ltd has produced a range, with prices starting at £7.99 for a box of thirteen. Managing Director Simon Kelly promises, 'if a customer can find branded disks of the same quality at a cheaper price, then Mydisk will refund the difference'. Each disk has a clipping level of 65% and comes with a 'two for one' guarantee, i.e., a faulty disk will immediately be replaced with two.

Brother has recently produced the 1724 - a letter quality dot matrix printer which will sell for £695. The 24 pin 1724 operates at 216 characters per second in draft and offers fast letter quality printing at 72 cps. The 1724 is compatible with Epson 1000, Diablo 630 and IBM Proprinter XL, and a dual interface, Centronics and RS232, is available. John Carter, Sales and Marketing Manager for Brother comments, 'the introduction of the 1724 extends our selection and supplements the 2024L in our 24 pin range'.

Strategy and Adventure

PSS have recently launched a new series of strategy games - with *Classic Conflicts*. Three of the titles are relaunched of the Classic PSS titles - *Theatre Europe*, *Battle for Midway* and *Battle of Britain*. Another title in the pipeline is *Power Struggle* which is a game of world domination.

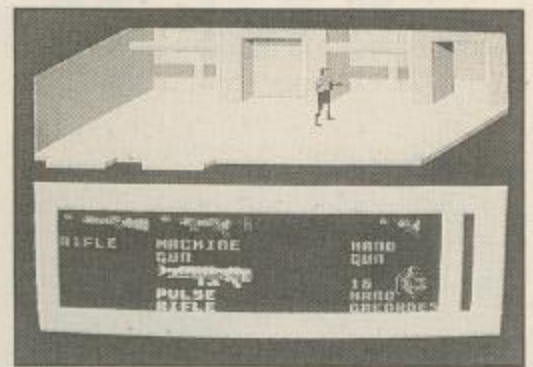

Classic Conflicts is available on C64, and will be priced at £4.99 (ca and disk).

Battle of Britain

CRL's follow-up to *Cyborg* is in the form of *Mandroid*. You are Cyborg and your mission is to retrieve the stolen blue prints and so they can be used for the good of mankind. This is a world of bandits, prostitutes, drunkards - a world of debauchery. However the longer you take to retrieve the blue prints the more Mandroids are put into production and you must discover how these complex machines are de-activated and ultimately find your way through the complex labyrinth to the safe which holds the vital information.

Mandroid is available on the C64, and will retail at £9.95 (ca) and £14.95 (disk).

Mandroid

Martech are putting the finishing touches on their racing game - *Nigel Mansell's Grand Prix*, and so all you budding drivers - be prepared. As the driver, you have access to the latest in car design and technology. Whether you simply want to blast around the track at excessive speeds with the turbo on maximum boost without a care in the world or whether you want to race a selection of the world's greatest circuits, this game is for those who enjoy the excitement of speed.

Nigel Mansell's Grand Prix will be available on the C64.

Airborne Ranger is a recent release from MicroProse and is an action simulation with 12 desperate missions in three different regions of the world. Tactical thinking and lightning reactions will win the day. *Airborne Ranger* will be available on C64/128, priced at £14.95 (ca) and £19.95 (disk).

A second MicroProse release comes in the form of *Stealth Fighter* - simulation of a radar elusive jet fighter believed to be testing as part of the US Air Force arsenal.

Stealth Fighter will be available on C64/128, priced at £14.95 (ca) and £19.95 (disk).

Business Bargains

Is Logotron's trio of business programmes a portfolio for success?

By Eric Doyle

Logotron has steadily built up a solid reputation through producing software for the BBC micro. Even C64 owners may have heard about XOR, the game that took the BBC fraternity by storm. Soon all C64 owners will have heard of Logotron when they enter the C64 market with their new 1295 business software range.

There are three packages in the set: a wordprocessor, a simple database and a spreadsheet. Nothing technically revolutionary except where cost is concerned.

Wordprocessing

Logotron Write 1295 is a sophisticated word processor with built-in spelling checker and mail merge facilities. It is simple to use, but there are one or two tasks which must be performed when you first use it.

The newly loaded program presents the user with a horizontal menu offering six categories: edit, option, print, storage, setup and quit. Selecting any of the categories will open up a sub-menu window showing the full range of options.

It is best to select the *setup* feature first because, as the sub-menu reveals, you have the opportunity to insert up to seven codes which allow you to

access some of the special features your printer may possess. You can also select ASCII or non-ASCII (normal Commodore) output, the inclusion of extra linefeeds or a specific device number and secondary address.

Under the sub-heading of *setup storage*, dual disk drive operation can be selected and a further heading allows the screen display colours to be changed. When all is as you would wish it to be, the fourth option allows you to save the parameters to disk to be automatically loaded each time you use the Writer.

Option opens up the possibilities of search and replace, preview and spelling check.

Search merely finds every occurrence of a specified word in the text. *Search* and *replace* not only finds the word but also replaces it with a new word of any length which you have selected.

Because the screen is only 40 characters wide and most printers work to an 80 column width, the preview option is essential. The formatted pages of your document appear just as they will on the printout. This gives you time to make those small changes which always seem necessary before you commit your work to paper.

It's a good idea to check your document for spelling mistakes before printing. This is a good option to have and surprising on such a low cost product. Unfortunately this option has a weak point: the given dictionary is fixed; you can't add or subtract words to cater for your specific needs.

Since the spelling checker only checks the words which it knows, 'catalogue' spelled in the American way (without the 'ue') will remain undetected because the word is not included in the dictionary's 1000 word database. All this apart, the spelling checker does work given this small limitation.

Storage allows disk access for loading and saving files, sending disk commands to erase old documents or to format a whole disk. The loading process is further simplified by the inclusion of a directory facility which lists all of the document files onto the screen. From the list you can load the file that you want by highlighting the required document name.

The next menu option is *print* which is not only for accessing the printer but is also for sending the current file to disk as an ASCII file. Here the special mail merge facility can be called, but more of that later.

Edit releases you from the menu so

that you can create a document and *quit* merely resets the computer to Basic.

Such are the facilities offered by this program that I've not yet mentioned the cut 'n' paste or the special feature menu. Basically the cut 'n' paste menu allows the user to move text around either replacing, replicating or erasing selected blocks. Regularly used sections such as copyright clauses or letter heads can even be merged in from disk.

Special features allow all of the special printer functions which have been defined previously. These can include underlining, boldface text, compressed text or expanded text. In addition right justification, headers and footers, page format, tab settings or centering can all be set. It is also possible to append files forming a chain of files should you be embarking on a novel or similarly long document.

The merge function works in conjunction with the Filer 1295 program. Fields may be selected from a file for insertion in documents. For example, if you are embarking upon an advertising mailshot to several companies, a standard letter is created and merge marks included where each company's address will appear. At print time the File database disk is placed in the drive. Each time the letter is printed a new address is pulled in from the disk and printed wherever indicated.

The text memory boasts about 19K of space. In real terms this means 19,000 characters, or approximately 3,500 words, or just under 500 lines making this a valuable wordprocessor for any user.

The Database

Filer 1295 is a simple database which is both friendly and cheap. The hard part is inputting all of the data which you want to store.

Each Filer database occupies a single disk so the maximum number of records is limited by the simple equation of free disk memory divided by the number of bytes which each record is allocated. The fewer the number of fields in a record, the greater the number of records per database.

In case I'm losing you at this point, let me explain filespeak. A *database* is a catalogue of grouped information. Usually the groups are individual and company names which, like entries in an address book contain various other details such as addresses, phone numbers etc.

In such a database a *record* would consist of all of the information referring to one particular company or individual. *Fields* are the individual entries which make up a record such as name, address, phone number etc.

One of the fields can be designated as the key field. This is the name under which the record will be entered and usually consists of the name of the company or the surname of an individual.

What is kept in a database is entirely up to the user when the record fields are defined. Filer 1295 has several field types to help in maximising the memory efficiency of the system. With only 250 bytes allowed per page, memory is at a premium. Using the full allowance of 25 characters per field, a disk will hold 288 records. Fields can fall into one of four types: keyfield, alphanumeric, numeric or data.

Once you've carefully entered all the records in your database, changes and deletions can be made or, free space permitting, further deletions can be made.

What you end up with is a very useful file which can be used in various ways. Files can be selected and saved according to criteria selected by your own needs. For example, if you want to separate out all of the people who live in the Leeds area, own a C64 and a car, you simply set these criteria and let the computer do the rest. If you then want to print out selected information from the database, such as name and address for labels, this can be achieved by generating a report sheet.

Within the limitations of ten fields, each holding 25 characters, quite a lot can be done but a lot of thought has to be applied first.

To maximise memory use you can use a coding system like binary for one of the fields. If someone complies with a particular criterion then a one is recorded, if not a zero is used. The result would be a number such as 1101 which could mean that the person in question is married, male, childless but car owning. To find other married car owners you could then specify a match to equal 1??1. The question marks mean that any character will be accepted for sex and parenthood, but only a positive indicator for marital status and car ownership will be accepted.

If you just want a list of married people you can ask the computer to find a match for 1*. This means that the first figure has to be a one, but the other figures can be anything.

Using a master chart these codes can be converted into real terms and

Filer 1295 may be a humble database but for most people it is powerful enough if used sensibly.

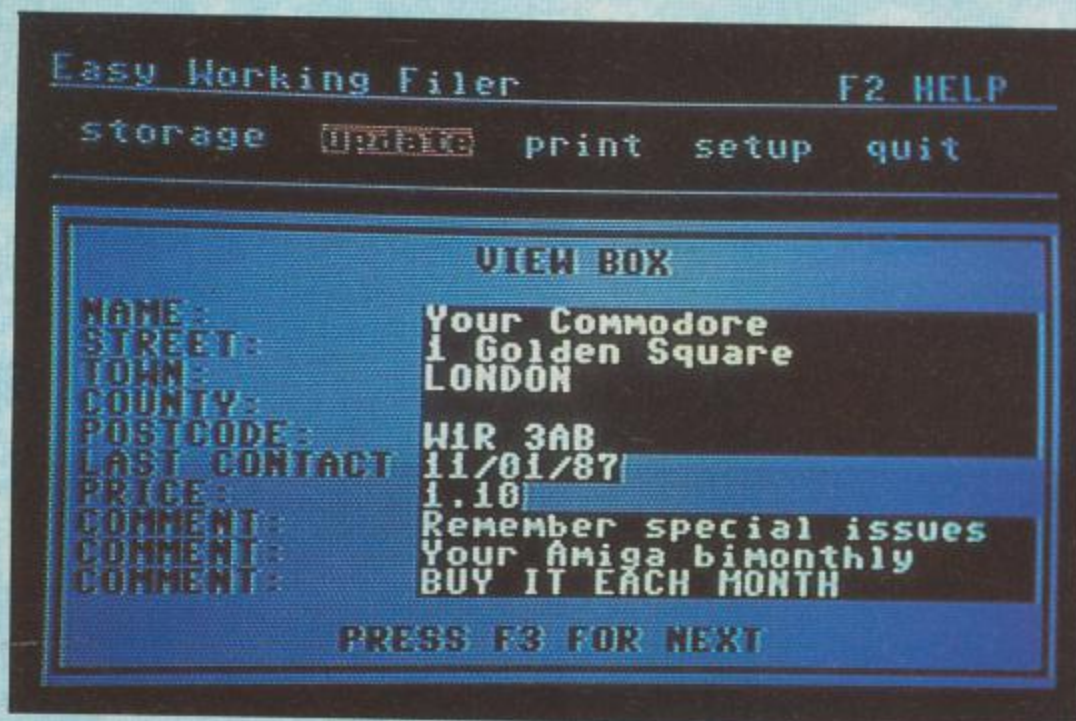

mathematical operators plus a few specially defined functions for dealing with group of cells. Using these commands the sum, difference or average of a group of cells can be calculated, and the maximum and

Conclusion

Logotron has three excellent products which were tailored for the British market from an American program created by Spinnaker Software. Planner 1295 is particularly comprehensive and writer 1295 is more than adequate for most people's needs. Even the weakest module, Filer, is powerful enough to be considered for small business uses. It is rare that a suite of programmes prove quite as satisfactory as this trio - perhaps they could become the Lotus 1-2-3 of the C64 world!

Touchline:

Software: Wordprocessor, Spreadsheet, Database. **Prices:** £12.95 each. **Supplier:** Logotron Ltd, Dales Brewery, Gwydir Street, Cambridge CB1 2LJ. **Tel:** 0223 323656.

The Spreadsheet

Planner 1295 is probably the most powerful spreadsheet available at this price range.

Starting with a fairly basic sheet of incomings and outgoings, the Planner will grow in complexity as your finances become more involved. Insertion and deletion of columns and rows is easily achieved, as is cutting and pasting whole sections for transplanting to another part of the sheet or across to another sheet completely.

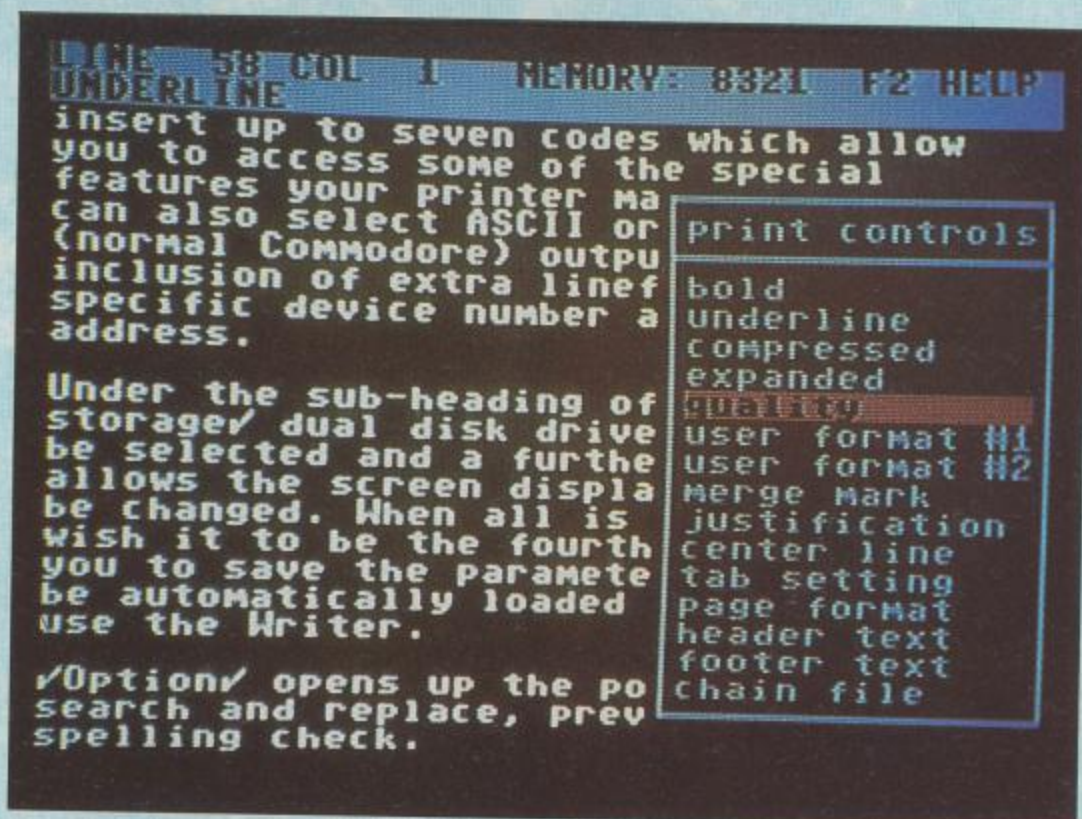

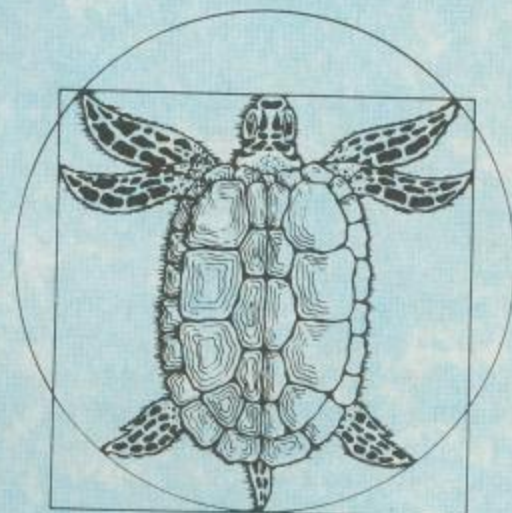

The advantage of these facilities is that detailed planning of the layout of your sheet is not essential. As long as you are somewhere near to your requirements, corrections can be made later.

The size of the sheet depends on the complexity of its contents. Columns can be set to any width from three characters up to a maximum of 37. Using a column width of 12, I still had about 7K of memory left when I created a 26x44 matrix!

Definition of cell contents is simplicity itself. If you want it for text just type in the letters; if it is to be a fixed value, type it in; for a formula type an equals sign first. Calculations can be extremely complex using all

minimum values can be found. The range is staggering.

Printing out the finished sheet has the usual limitations of paper width. If the spreadsheet is more than 80 characters wide, it is possible to select different areas of the sheet, print them out and then use sticky tape to recreate the full spread.

Kernal II

Add easy file handling and much more with this pull down menu system.

By Patrick Chable

The Commodore 64 may be a great computer but no one will deny that its file handling could be greatly improved. After all, if you need to get a directory on a normal C64 you have to erase the program that is currently in memory.

Kernal II will patch itself into the C64s operating system and provide you with a series of menus that will greatly improve the ease of which you can LOAD, SAVE and find details on programmes.

When the program is in use, an arrow is resident on the computers display. This arrow can be moved around the screen with a joystick in port 2. Across the top of the screen a strip is displayed giving the titles of the pull down menus available. These are, DISK, TAPE AND OPTIONS. To activate the menu you must position the pointer over the option and press the fire button. All of the commands available under that heading will appear. To select one, move the pointer to the command that you require and press fire.

All commands, having carried out their work, display an OK prompt. Just place the pointer on this, press

fire, and the machine will return to the program that was running before the command was executed.

As well as offering pull down menus the operation of a few keys is altered by the program. Pressing F1 stops the computer and F3 restarts it. This allows you to stop a Basic listing or a directory listing. The RUN/STOP and RESTORE keys will not perform a warm reset as normal.

Below you will find a list of all of the functions available from the program.

Disk Menu

SAVE - this routine allows you to SAVE a program or a block of memory. The computer asks you for the file name. Type this in on the keyboard in the normal way, delete mistakes with the DEL key. KERNAL II will not allow you to enter a name with more than 16 characters. If you try to enter more the program will automatically jump to the next SAVE option. If you don't need a program name as long as 16 characters you can press RETURN once you have entered the desired number of letters.

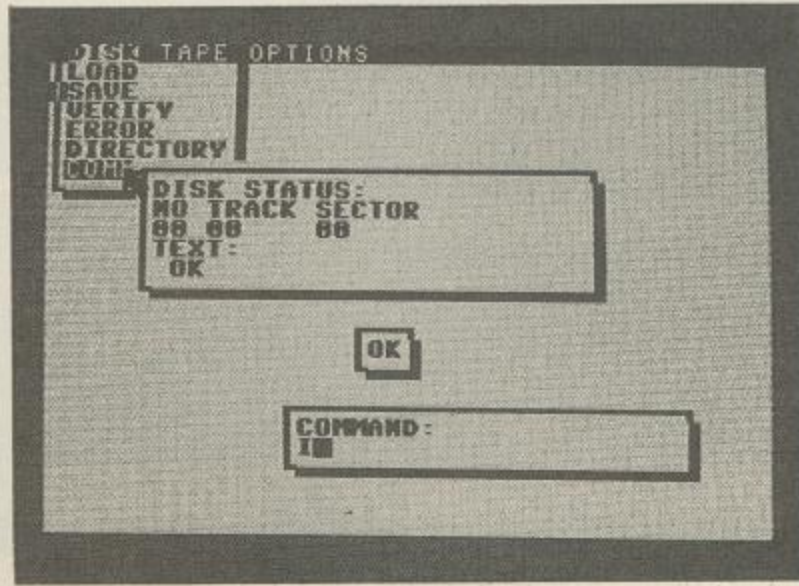

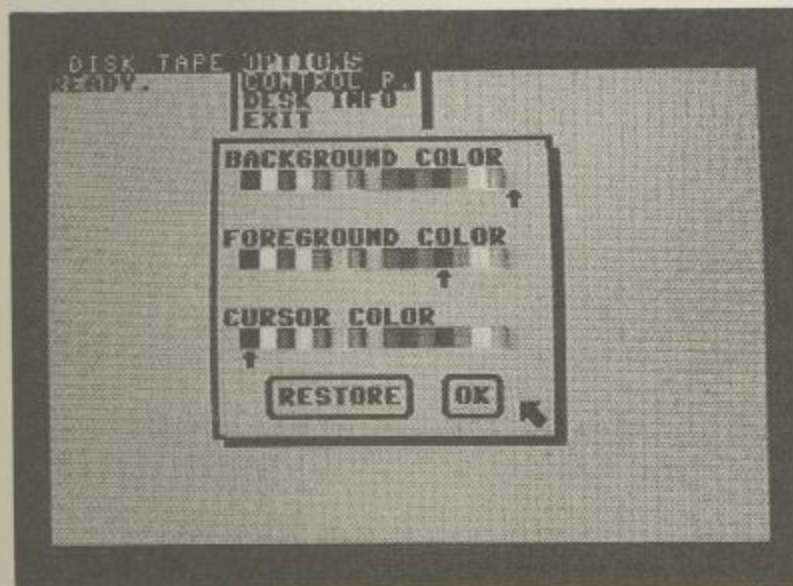

Once you have entered the program name a second pull down menu will be displayed. First you are asked whether the program is BASIC or ELSE. Move the arrow and press fire to select the desired option. BASIC means that the program to be SAVED is Basic and will be SAVED in the normal way.

If ELSE is selected then you are allowed to SAVE machine code. You are prompted for the start and end address of the code to be SAVED, in hex. These numbers must be four digits in length, i.e. 80 becomes 0080. This program could be SAVED with this option. The start address is 8000 and the end address is 92B0.

LOAD - this works in the same way as SAVE. If ELSE is selected for the program type then you are just prompted for the address where you want the LOAD to start. N.B. Basic programmes are LOADED into the computer as though you had entered LOAD "name",8,1.

VERIFY - this will verify the specified program on disk.

ERROR - this command reads and displays the error status of the disk drive.

COMMAND - the normal disk commands, e.g. I,N,S etc, can be entered here.

DIRECTORY - this routine will display all files that are on the disk, even deleted files are displayed. You can pause the listing with F1 as detailed earlier. RUN/STOP will stop the listing and exit with an OK. N.B. It may be necessary to initialise a disk with the 10 command before displaying a directory.

TAPE MENU

SAVE, LOAD and VERIFY options are identical to those for disk, but operate with the tape deck.

OPTIONS MENU

CONTROL PANEL - this routine will allow you to change the colours of the

border, screen and text. When you leave this with an OK the colours are set in memory. Using the RUN/STOP and RESTORE keys, or the restore, option will return the screen to these colours.

EXIT - this command returns the computer to its normal state, without KERNAL II. You can start the program again with:
POKE 32772,195

followed by:

SYS 64738

Kernal II uses files 15,1 and channels 15,1 so take care not to use these in your own programmes. The program is stored in memory from \$8000 to \$92BD. It also uses memory in the \$C000 to \$A000 region. Since this program patches into the operating system it is extremely unlikely that it will work with commercial software.

Getting it all in

The program is presented here as a Basic Loader that POKES all of the machine code into memory. Use the SYNTAX CHECKER program when entering the program to help with your typing, see LISTINGS page.

Once the program is in memory you can SAVE a working version of the program using the SAVE, ELSE commands within the program and specifying a start and end address as detailed within the article.

The machine code version of the program SAVED in this way will obviously LOAD much faster than the Basic version. To use this program you should type:

LOAD "name".8,1 for disk or
LOAD "name".1,1 for tape.

Once the program has LOADED enter SYS 64738 to start it.

COMMODORE PLUS-4/C16 NEW!-BANGS AND CRASHES!! RHYTHM BOX

This Rhythm/Drum box will set your feet tapping! At a very modest cost you can sequence a wide variety of digitally recorded percussion sounds. Very easy to use. No knowledge of music is required. In seconds you can set up pulsating rhythms to accompany your music. A variety of drums, tom toms, cymbals and a bass guitar combine to produce sounds you never thought possible on the C16/Plus 4. Easy entry of rhythms and a powerful pattern editor. An excellent package - good value at £7.95 cassette £9.95 disc.

NEW!-WISP Amazing new product!

WISP offers you a refreshing new way to operate your PLUS 4. WISP stands for Windows Icons Silicon-disc Package. It is packed with many powerful features. Everything in your new operating environment is run through windows - just like on very expensive computers. Built in window facilities include a) calculator b) silicon disc c) note pad d) directories e) fast load and save f) error trapping g) programming windows.

Windows may be closed and neatly stored as icons. A smooth sprite is used to select the windows you wish to use from the pull down menus.

With the silicon disc you can instantly save, load and directory - all in under half a second (much faster than even a disc drive!).

The fast load and save to cassette is about ten times normal speed! We have never before sold such a feature packed program to give you power to control your computer to its limits. The ultimate programming environment. Incredible value. Plus 4 only. Cassette - £9.95 Disc £14.95.

NEW!-BLACK CAT 2

We have black cat 2 in stock and waiting to be despatched to you! Have you ever wanted to use your PLUS-4 Wordprocessor, Spreadsheet, Business graphics etc, with a cassette unit? This program allows you to save your files to cassette rather than disc (as forced to by Commodore).

Version 2 incorporates a FAST load and save system so you can save your files to cassette at disc speed! Quick, convenient, easy to use. Only £5.95

THE MIRROR-TAPE BACK UP

Super tape to tape back up copier catering for many PLUS-4/C16 games. Backs up both standard and FAST loading software. Very popular utility - Excellent Value - £7.95

THE WAND-TAPE TO DISC

Make full use of your disc drive by effortlessly converting many of your games/software to disc. We have had many letters telling us how much people appreciate this utility. Excellent value - supplied on disc - £12.95

PHOTON LOAD- FAST LOAD AND SAVE

Have you ever wasted time waiting for your programs to load or save? PHOTON LOAD, the new cassette operating system loads in seconds and allows you to load and save your programs at about TEN times the speed of a normal load or save. Why spend money on a disc drive when you can load and save this fast. Great value £7.95

SUPER SPRITE

This extremely clever utility allows you to use 8 sprites simultaneously over a low-resolution screen. With this program you can now imitate the sprites found on the Commodore 64! A complete package with FREE demo programs and a FREE sprite designer. What more do you need to bring real power to your games on your C16/PLUS 4. A must for games programmers. Excellent value - Cassette £7.95 Disc £9.95

ELECTRIK PENCIL!!!

A truly excellent high resolution art program. Magnificent masterpieces can be quickly drawn using the powerful facilities provided by this package. Impressive results in no time at all. Cassette only £7.95 Disc only £9.95

CASSETTE INTERFACES

If you have a Commodore 64 cassette unit which you would like to use with your C16/PLUS 4 then you need one of these. Just plug in and go! - Only £5.95

MERLIN ASSEMBLER

100 o/o machine code assembler for the Plus-4/C16. Very fast assembly of source code. Easy entry/editing of code via the full screen editor. Full load/save and printer facilities. Variable names, labels, hex/decimal, text and data statements, remarks, post indexing of variables etc. Many other facilities too numerous to mention. Highly recommended - A truly superb assembler. Comes with instruction booklet and working examples of machine code routines. READ THE EXCELLENT REVIEW IN YOUR COMMODORE - MARCH 1987. Cassette £8.95 Disc £13.95

JOYSTICK ADAPTORS

Converts any joystick to Plus 4/C16 format. Simply plug in and go! Only £3.50

Tape Head Alignment C16/+4

The perfect cure for the majority of loading programs. Specification as for the Commodore 64 (see below). Only £6.95

COMMODORE 64 EVER HAD A LOADING PROBLEM?

Then send off for WIZARD'S "TAPEHEAD ALIGNMENT KIT 64" - The most common cause of loading failure is bad alignment of your tape heads. This kit allows you to set up the tape heads of your cassette unit for the BEST possible loading conditions. In many cases this will make a remarkable difference in loading reliability. The complete feature packed kit - £6.95!!!

RAPID despatch of orders.

Send an S.A.E. for our current catalogue with full descriptions. U.K. P&P FREE and by FIRST CLASS post. Europeans please ADD 50p. Outside Europe ADD £1.50 for AIR MAIL. Overseas orders welcome. All payments must be made in pounds sterling. Cheques/POs to:

WIZARD SOFTWARE (Dept. Y101),
20 Hadrian Drive, Redhills, Exeter,
Devon EX4 1SR.

WIZARD SOFTWARE (Dept. Y101) 20 Hadrian Drive, Redhills, Exeter, Devon EX4 1SR.

Function Key Template

It is not easy remembering all the functions of the C64 Keyboard. A program using the C64 and 1520 printer/plotter can solve the problem by producing a template.

By John Allison

The Commodore 64 keyboard has only four function keys, but each one can be used in four ways. The function keys can be pressed on their own or in conjunction with the SHIFT, CBM (the key with the Commodore symbol on it) or CTRL keys. This gives up to sixteen key definitions. In the Extended Basic program given away on tape with the November 1986 issue of *Your Commodore* all sixteen function keys can be programmed.

This can make program development much simpler and easier, especially as the keys can be easily re-defined by the programmer. However, there is a small problem. When you have defined the keys and are merrily typing away and want to use one of the function keys to save time and trouble, you cannot remember which key gives the proper result! Was it 15 or 16? And is it CTRL and function 7 or is it CBM and function key 7? If you have a Commodore 1520 printer/plotter, as well as a 64 computer, this program will solve these dilemmas. It will produce a template which can be fitted over the keyboard around the function keys. The template will remind the user of each function key definition and which key combination to press to obtain it.

Commodore 64 Function Key List

The C64's sixteen functions can be obtained, providing that they have

EXBAS YR COMM			
DIR←			MEM←
H-D			D-H
LIST←			AUTD←
B-D			D-B
CODE←			HI
RENUM←			TRACE←
PAUSE←			LO
TROFF←			QUIT←
F KEY ONLY		SHIFT + F KEY	
CBM + F KEY		CTRL + F KEY	

been previously defined, by pressing the key (or key combination) listed below:

Function

- 1 = F1 key only
- 2 = SHIFT key + F1 key
- 3 = F3 key only
- 4 = SHIFT key + key
- 5 = F5 key only
- 6 = SHIFT key + F5 key
- 7 = F7 key only
- 8 = SHIFT key + F7 key
- 9 = CBM key + F1 key
- 10 = CTRL key + F1 key

- 11 = CBM key + F3 key
- 12 = CTRL key + F3 key
- 13 = CBM key + F5 key
- 14 = CTRL key + F5 key
- 15 = CBM key + F7 key
- 16 = CTRL key + F7 key

The CBM key is on the bottom row of the keyboard at the left-hand side, marked with the Commodore symbol.

Keying-In The Program

Type in the program given in the listing. Save the program to tape as "KEY TEMP". The program will automatically save to disk (device 8) if you enter GOT02 (Return) at any time while entering the listing. Type the GOT02 command as a direct command (on a clear line with no line number). Doing this regularly, for example when a screenful of lines has been entered or when having a few minutes break, will save having to retype those lines if the computer accidentally loses them, or is switched off before the program is saved. Make sure that a copy of the full program has been saved from RUNNING it.

Using the Program

Before RUNNING the program connect the 1520 printer/plotter to the 64 and ensure that it is loaded with paper and that the pens are loaded in the right colour order. Switch on the power supply to the printer/plotter.

Load and run the KEY TEMP program and answer the questions as

they are displayed on the screen.

The program will produce a template with sixteen function key labels but usually only eight are needed, which the program allows for. Any label can be left blank by just pressing (Return) when the label name is asked for. Do not use punctuation marks (commas, full-stops, etc.) and when some graphics characters are not printed properly on the 1520, consult the 1520 User's Manual for more information. The backarrow can be used, and I use it to denote that the function key command includes a (RETURN). Confirmation of the label name is required to avoid wasting time and paper. The label descriptions are also displayed just before printing starts to reduce the risk of printing a wrong template.

"The template will remind the user of each function key definition and which key combination to press to obtain it."

Fitting the Template

The paper used in the 1520 is very thin and not satisfactory to use on its own as a key template. To remedy this it should be backed with a piece of stiff card. The surface of the template can be laminated with transparent film to protect the surface from dirt, fingermarks, etc.

Back the template, before it is trimmed to size by fixing it to a piece of card and prick the corners with the point of a pair of compasses or something similar as shown in Figure 1. Remove the template and mark the lines joining the holes in the card made with the compass point. Cut the card with a sharp knife in the shape of the template along the marked out lines. Check that the card fits on the keyboard and that there is sufficient clearance for it not to interfere with the operation of the keys. Trim the edges as necessary.

Cut the outside of the paper template and on the inside cut out leave 1/8th of an inch inside the lines, making a diagonal cut into the corners.

Cut a rectangle of transparent film

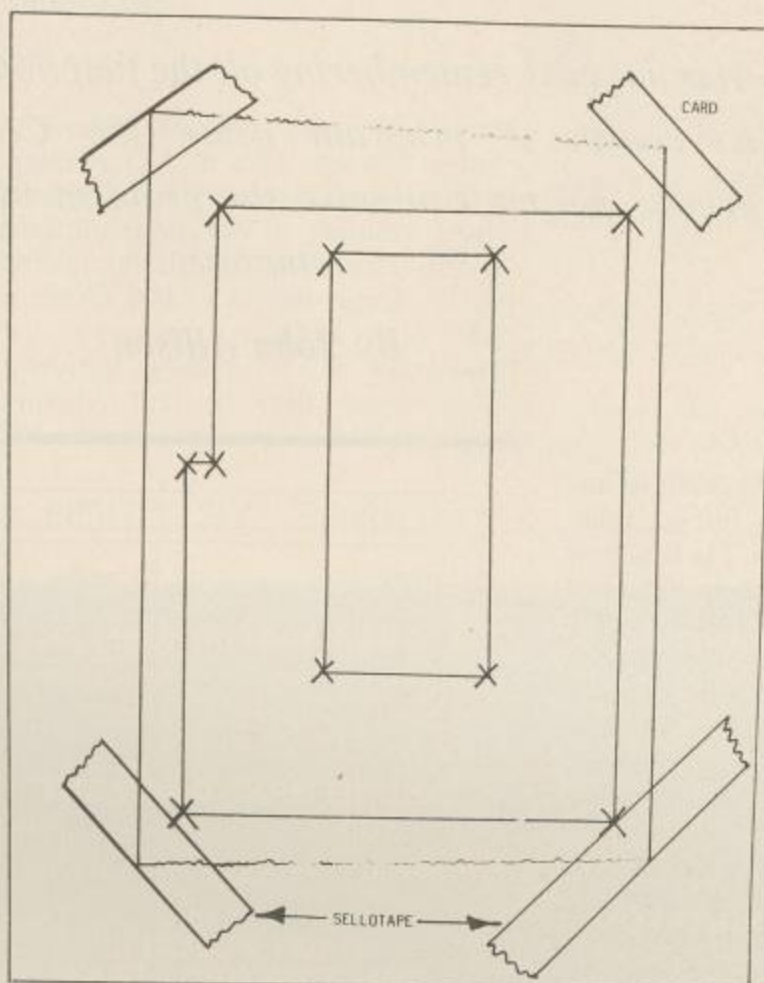

(I recommend Transpaseal which is available from W.H. Smiths) about 1" wider and 2" longer than the template. Peel the backing off the film and lay the film sticky-side upwards on a flat surface. Carefully lay the paper template — print-side downwards — on the film. Cut the corners of the film as shown in Figure 2.

Position the cut-to-shape card

accurately over the paper template and fold the edges of the film over and press on to the back of the card. Next fold the film in the centre cut out. This will hold the paper template securely to the card.

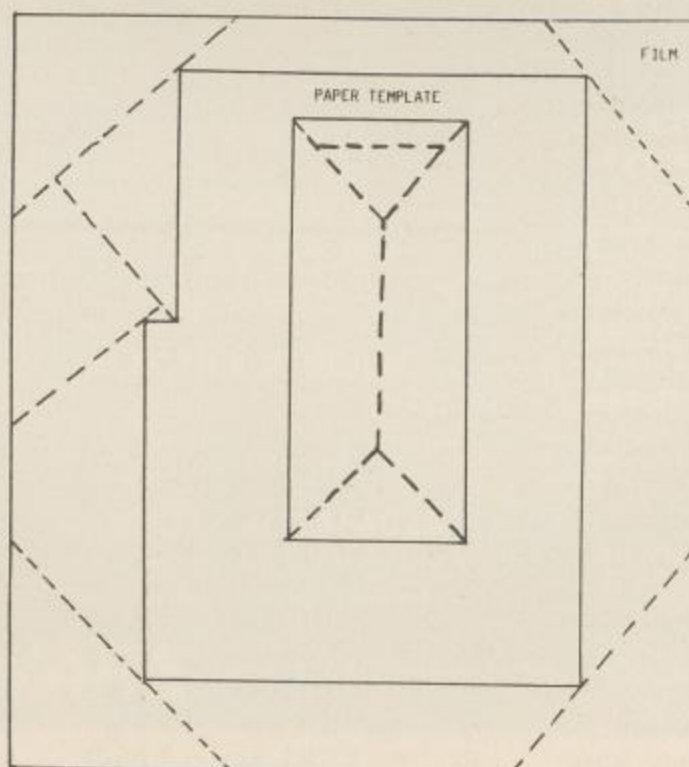

Finally, fit the template to the keyboard and hey presto — no more relying on the grey matter!

Sci-Fi Games

Zap into the future with this selection of high-tech games from Electronic Arts.

By Tony Hetherington

Space, the final frontier. These are the games that can take you into the unknown as you fight, trade or explore your way across the galaxy. These games cover the whole spectrum of computer gaming from the coin-op conversions of *Nemesis* and *Quartet*, to the adventures of *Silicon Dreams* and the *Hitch Hikers Guide* and the strategy of stopping the *Ogre* or surviving in the *Autoduel* arena.

The *Hitch-Hikers Guide to the Galaxy* was originally a radio series, then a TV series and a play and several books until finally, thanks to Infocom, an adventure. The result is probably the best adventure you will ever play. It will certainly be the funniest as it combines the humour of Douglas Adams with the usual blend of fiendishly difficult but so obvious (when you eventually solve them!) Infocom

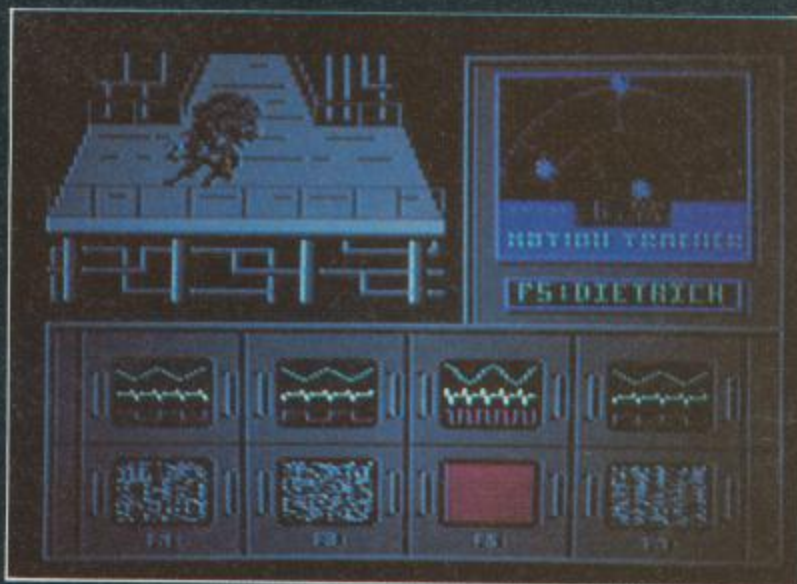

Portal

logic problems.

This, laugh as you suffer adventure, will have you riveted as you try to find a way past the bug blatter beast of Traal, build an improbability drive and try and get some sense out of Marvin the manic depressive robot and many other equally impossible tasks. The game is obviously based on the radio series, and associated books but has a new plot so there're no short cuts for those players who already know where their towel is.

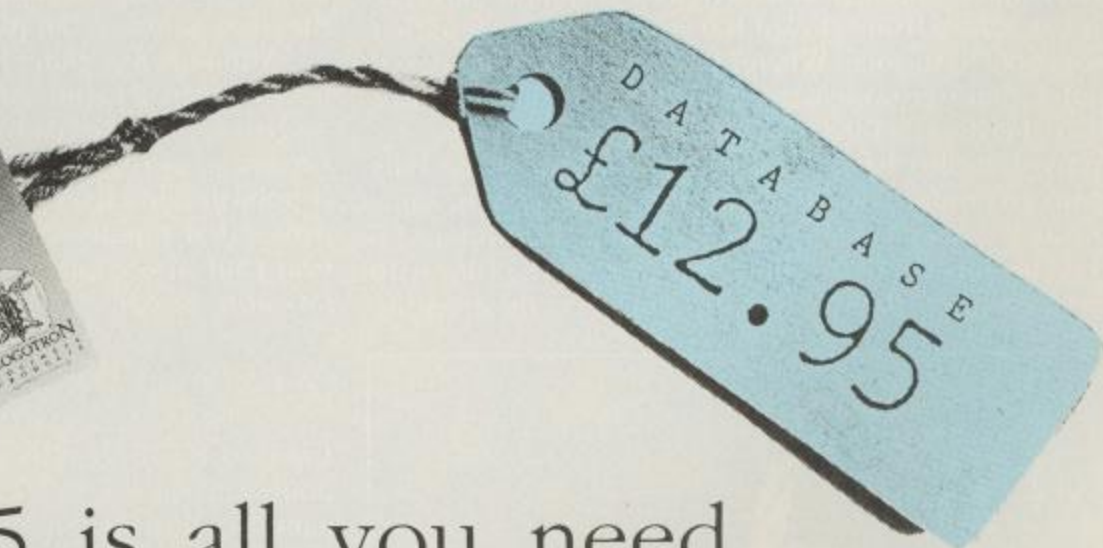

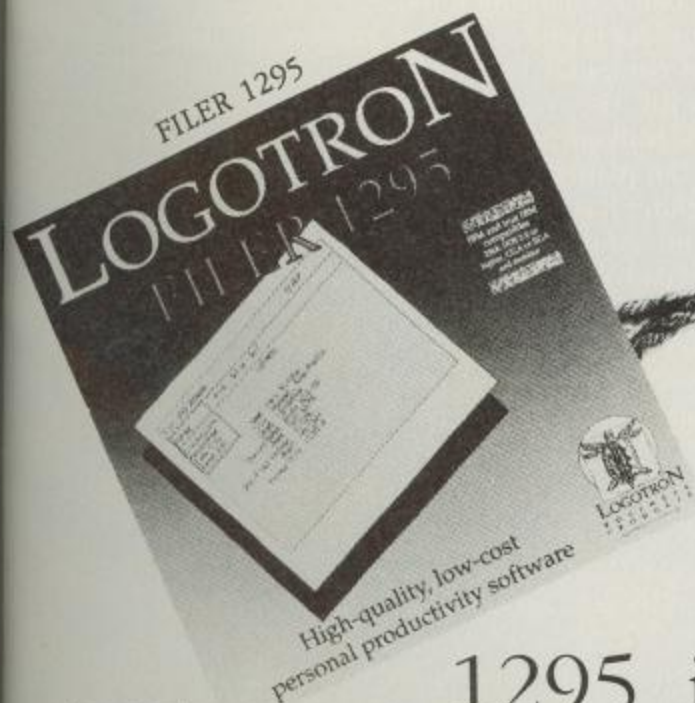

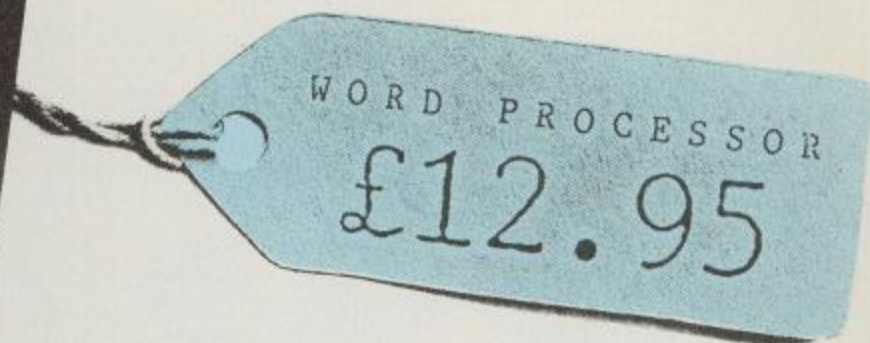

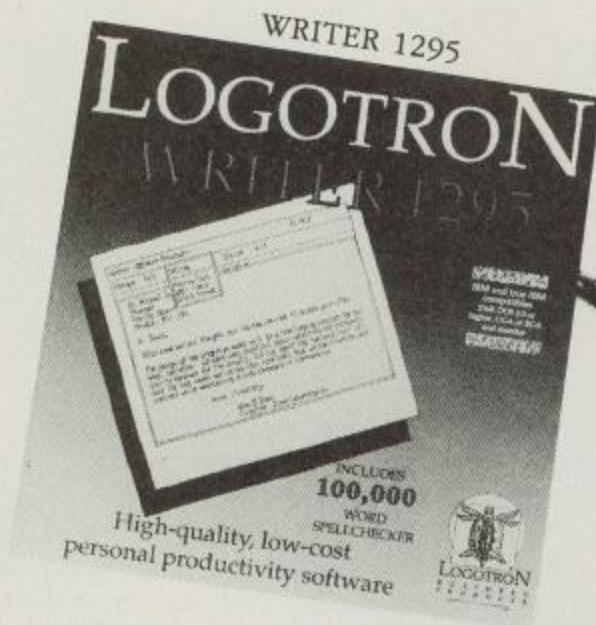

Explore New Frontiers

Infocom also feature a growing supply of Sci-Fi games for adventures needing to explore new frontiers. *Stationfall* is the sequel to the equally puzzling *Planetfall* in which you're a deck scrubbing Ensign 7th Class survivor, when your space cruiser crashes only to get into deeper trouble. *Stationfall* continues the adventure.

Aliens

Leather Goddesses of Phobos is an experience you won't forget as it's a game that you can play at three different levels ranging from tame through suggestive to lewd. Your mission is to stop the leather Goddesses fiendish plan to reduce the Earthmen to a race of sex slaves and to help you out you'll find a 3D comic to read and in the box 3D graphics to read and an intriguing scratch and sniff card! Some of the older games can still be found at incredibly low prices such as *Starcross* and the weird and wonderful *Suspended* which sets you in suspended animation and your only way to explore and save an impending disaster is by controlling six very peculiar robots.

1295 is all you need

LOGOTRON

1295 BUSINESS SERIES

Fully integrated software for the Commodore 64/128, IBM PC and all IBM compatibles

For all the information telephone or write to **Richard Laidler** at:
Logotron Business Products, Dales Brewery, Gwydir Street, Cambridge England CB1 2LJ ☎ (0223) 323656

Futuristic Graphics

On this side of the pond, only Level 9 have stemmed the Infocom tide with their own trilogy of futuristic adventures now marketed by Rainbird as Silicon Dreams. These adventures packed with illustrations and text descriptions to match, tell the tale of Kim Kimberly and his descendant who are caught up in the colonisation of the Planet Eden.

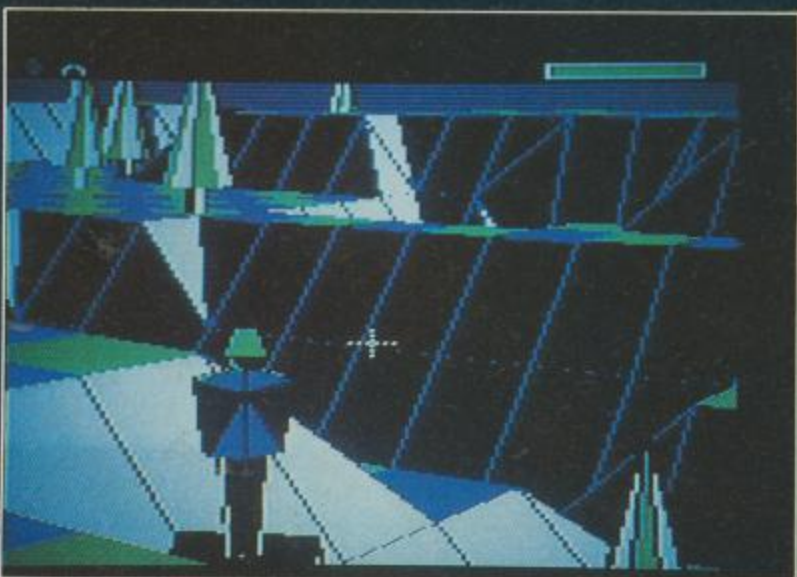

The saga begins on the colonisation ship in Snowball where you find trouble. In Return to Eden you must escape the avenging crew of the Snowball (I told you there was trouble) and find the robot city of Enoch only to find in the final part the Worm in Paradise that there is something desperately wrong with this robot serviced city. The robots have taken over!

Quartet

Activision's Portal is described as a computer novel in which you return from a failed 100 year mission to find that all the people have gone. Where? Using Homer, a biological computer, that's growing weaker and weaker you must piece together the story before it's too late.

Activision also have the distinction of being the only company to produce two different games based on the same film sequel - Aliens. The American company produced a multi-game version that follows the plot of the film with stages representing the scenes in the film where the dropship

Sentinel

lands on the planet, the rescue attempt to free the trapped marines, you hold off hordes of aliens as the team cut their way out of the operations room, a mad scramble through the air ducts, a race against time to find and rescue newt and the final duel with the Alien queen.

Meanwhile, Electric Dreams (part of Activision UK) has its own version that captures the atmosphere of the film but not the actual plot. Your mission is to guide your six marines through the rooms of the Alien infested complex. The action is tense and incredibly exciting.

Covering up a Bad Game?

In that arcades the science fiction action is little more than left/right/fire games in which an unbelievable variety of aliens are destroyed by players of countless games. In fact the science fiction label is stuck onto the strangest games usually to cover up a poor game or rehash and revitalise a rewrite of an old one. For example, Archanoid is an exceptional rewrite of the original breakout but it's hardly science fiction. Two exceptions to this are Quartet and Nemesis.

Quartet is the sci-fi equivalent of Gauntlet except that it's a side on scrolling game converted by Electric Dreams in which the player selects one of the game's four characters to fight their way through the screen.

Nemesis (Konami) is one of the best coin-op conversions as well as being a top shoot-em-up where your ship and your chances of success get better as you blast the enemy until finally you have a high speed craft armed with lasers and missiles as well as two laser firing remotes.

Rainbird's Starglider is one of the few games yet to make the transition from computer to arcade as more and more players grapple with the vector graphic tanks, missile launchers stompers, walkers and flying stargliders to avenge the occupation of the planet Novenia.

Although Starglider has made the breakthrough it could have happened to any number of quality shoot-em-ups such as Novagen's Mercenary, CRL's Tau Ceti (the C64 disk version is incredible), Alligata's Trap and, of course, Elite (Firebird) and Hewson's Uridium. Elite and Uridium were games that rapidly set standards that other games had to beat (but also copied) and will always remain two of my favourite games.

Brain Power Wins

Firebird has since followed up its elitest success with the double act of Cholo and Sentinel. Sentinel is an incredible game in which you must use your brain and your reactions to defeat the Sentinel over a staggering 10,000 battlegrounds. The Sentinel stands on top of the highest peak in each of these lands and absorbs all excess energy. Your task is to teleport from robot shell to robot shell until you can strike at the Sentinel while avoiding the Sentinel's deadly draining stare.

In Cholo you've just realised that mankind is trapped underground. The robots were supposed to let you out once the radiation levels had subsided. Now you have only one chance of escape as you've managed to regain control of a general purpose robot called Rizzo. If you use him well and don't make too many mistakes you may be able to recruit more robots to fight the rebels. Cholo is a little slow

compared to other games, but once you're into it you're hooked.

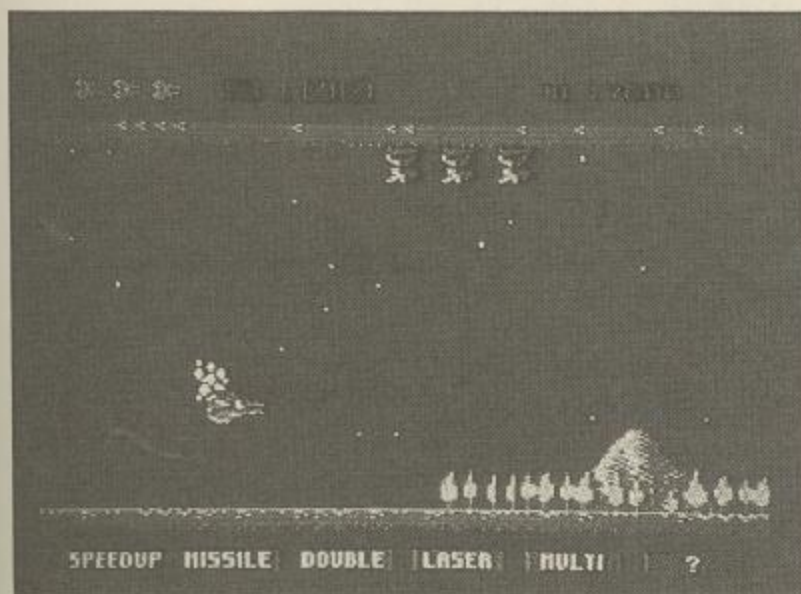

The hardest sci-fi game has got to be Accolades (imported by US Gold) Psi-5 Trading Company. The game features some impressive graphics and an easy game system. I can even cope with selecting a crew from the 30 galactic oddballs that you get to choose from but I always seem to get blown up and plundered by pirates on my first trading flight! Has anyone finished it?

Starglider

Ogre is set to be the next computerised board game to follow Autoduel and will be a strategy science fiction wargame between two sides. One side must defend a command post with a force of tanks, infantry, howitzers and GEV's (Hovercraft), the other side has only one piece. That piece is the Ogre, a living cybernetic supertank armed with massive guns, anti-personnel mines and missiles. If you can't wait for the computer version you may still be able to track down the original board game. If you find it, buy it!

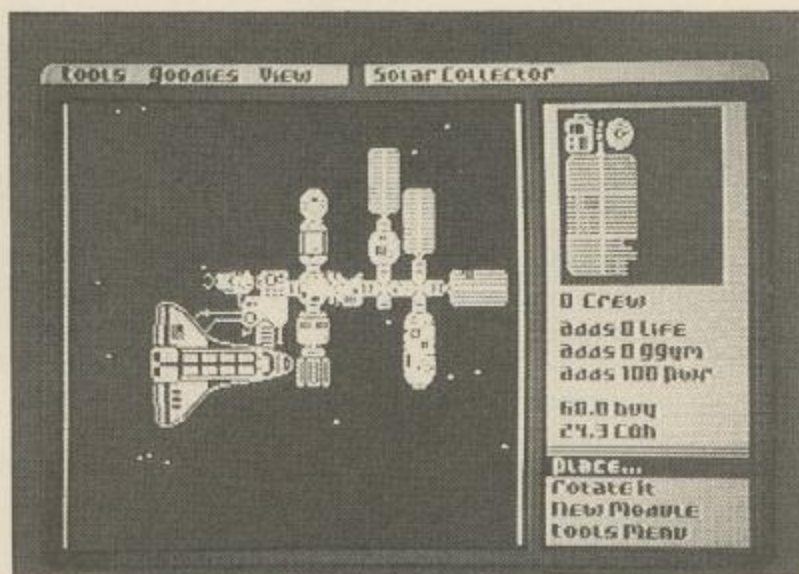

Autoduel (Origin Systems via Microprose) casts you into the strange role playing world of Car Wars. It's hard enough to survive in a world where you must build, armour and pile weapons onto custom cars that then either plug it out in arenas or battle on the open road. As you get the smell of petrol, smoke and blood in your nostrils you'll want to drive on until you're the best. Drive offensively, the life you save could be your own!

Electronic Arts, the latest US software house to setup shop in the UK, have just released EOS (Earth Orbit Stations). Seven missions drive 1-4 players deeper and deeper into space as they compete to build bigger, better and more profitable space stations.

Depending on the scenarios which range from building a dry dock in Earth Orbit to a race to search for life you will have set number of turns or quarters to build set space stations or race to have the highest technology level. Whatever the mission your first priority is make as much money as you can to be able to fund the target projects.

Every space station needs a command centre and logistics module and then as many power plants, life modules and galleys to provide the people, power and support for any of the money making or research getting installations such as spaceports, chemical labs, weather or

communications satellites, forestry labs or space tugs. As you make more and more money (hopefully) you can turn some of your modules from commerce to research and build up your tech. level which may earn you victory points and allow you access to the more complex and profitable modules.

A successful player will also have to play the markets and set as high a price as he thinks he can get for the goods created by his modules. Get this right and you can get ahead in the space race.

The game is played through a selection of menus between 2-4 players that can human or computer opponents. It's easy to learn but can be tricky to play particularly when you're trying to judge how many life, power and galley points you need to install a new module.

Touchline:

Title: E.O.S. **Supplier:** Electronic Arts, Langley Business Centre, 11-49 Station Road, Langley, Nr. Slough, Berks SL3 7YN. **Tel:** (0753) 49442. **Machine:** C64. **Price:** £16.95 (disk). **Originality:** 7/10. **Playability:** 8/10. **Graphics:** 6/10. **Value:** 7/10.

Finally, over a year since its announcement we are still waiting for Star Trek - the game. Beyond's stand at last year's PCW show was built to look like the bridge of the Enterprise. I have played the Atrai ST version (which is expected to beam down in the next few months) but all Beyond will say about the C64 version is 'it's being done'.

Contributions

*So you own a Commodore? So you've
written some programmes? So why haven't
you sent them to us?*

Your Commodore is always on the look out for new programmes, hints and tips, articles and even regular series. In fact if you have something that you think could be of use to other Commodore owners we want to hear about it.

So if you have got something which you think we may be interested in. How do you go about submitting it to us?

Below you will find a list of guidelines that will help us to deal with any item that you send in to us. We don't expect everybody to be the next William Shakespeare but if you do follow these simple rules then it will make our job a lot easier.

1) If possible all material sent to the magazine should be typed or printed out on a computer printer.

2) All text should be double spaced i.e. there should be a blank line between each line of text. You should also leave a margin of about 10 characters around the text.

3) On the very first page you should put the following:

Name of the article
Machine that it is for
Any extras required - disk, printer etc.
Your name
Your address
Your telephone number

4) The top of every page should have the following information on it:

Abbreviation of the article title
Your name
The page number

For example, suppose you had submitted an article on C64 interrupts. You should put something like the following at the head of the page:

Interrupts/J.Smith/1

5) Please make sure that you do not make any additional marks on your text especially underlining.

6) Try and write in clear concise English, it does not have to be a work of literature but it must be comprehensible.

7) On the bottom of each page you should put the word MORE if there are more pages to the article or ENDS if it is the last page.

8) If possible, enclose a listing of all programmes.

9) Under no circumstances use a staple to hold the pages together. Use a paperclip instead.

10) Programmes should be included on either disk or tape. Make sure that you SAVE two copies of every program so that we have a better chance of loading them if problems occur.

11) Programmes under 10 lines can be included in the text. If your program is longer than this you must enclose a disk or cassette.

12) If your article needs any artwork then supply clear examples of what is needed. We don't expect you to be an artist but we do need to see what is required.

13) Photographs, if necessary, must be either black and white prints or colour slides. We can take shots ourselves so don't worry about this too much.

14) Submissions of any length are welcome. If you have a five line routine that you think may be of use to someone else we welcome it just as much as a full blown six part series.

15) Payment varies quite a lot and depends on quite a number of factors, such as complexity of program, presentation of program, number of magazine pages it takes up etc. Payment is generally between £10.00 and £800.00.

16) All payments are made in the month that the magazine containing your article has appeared in print.

17) If we do find your submission suitable for inclusion in the magazine we will write to you giving the terms of publication, the rate of payment and an agreement form. Prompt return of this form will allow us to use your program as soon as possible.

18) If you want the program returning to you, should we find it unsuitable for publication, then you should enclose a stamped self addressed envelope.

19) If you use a wordprocessor then enclose a copy of your text on the disk and state clearly which wordprocessor you use.

20) Send your programmes/articles to:
Your Commodore
Submissions
1 Golden Square
London
W1R 3AB

21) Your Commodore cannot accept any responsibility for items sent to the magazine.

The ICPUG Column

With the growing popularity of the Amiga, many ICPUG members are using their utilities for both the Amiga and the Commodore, which can lead to problems.

By Tim Arnot

Well, now that we've got the introductions out of the way, and the commode...oops, Commodore show report, we can get down to what this column is really all about. Namely whizz-bang-techie-guru-magic (what?).

ICPUG's membership covers the whole spectrum of Commodore computers from the early KIM-1 through VICs, 64s, 128s and Amigas. In our bi-monthly newsletter-come-journal, we try to reflect this wide range of interests. However, we can only print what our contributors write, and so this policy does not always work.

At a recent committee meeting, it was stated that 95% of enquiries we are receiving are from people who already have or are seriously considering buying an Amiga 500. This leads me to think that in maybe a year or two, the 64 and 128 will be reduced to the historical status of the PET and VIC. Indeed, the muted presence of 8-bit products at the recent PET show (or is it Amiga show?) would tend to confirm this.

Before that happens, there will be a transition period, where people are using both technologies. As they move

from 8 to 16 bits, they are likely to want to take their wordprocessor, spreadsheet and database files with them. This is the problem which I will expand upon this month.

Compatibility Problems

The first problem comes when you take your data disk out of the 1541 and insert it into the Amiga's internal disk slot - it won't fit. Commodore's engineers, normally very clever people, seem to have made the hole too small. Being resourceful people, they made the diskettes fit by reducing their size. Unfortunately the media now falls out, and the protective cover just disintegrates!

Thus, they produced a stronger, plastic jacket for this smaller disk, and for good measure, threw in a metal shutter to protect the surface from baby and the cat. The polarised casing also stops people from flipping the disk, a deplorable practice anyway, as it sure gets my 1571 confused! Then, to add insult to injury, they did away with that nice G.C.R. recording system that we're all used to, and started to use

some alien mush called M.F.M. Just because every other jack computer uses it, it is no reason for Commodore to start.

OK, so we've got to get our stored information from the 1541 onto a disk which is the wrong size, records in a foreign language and has a strange directory structure. We might also have to convert from PETSKII or screen codes to ASCII, but given a small amount of programming expertise, that's not a real problem. Presuming we know that the 64 will read the 5.25" disk and the Amiga will write the 3.5" disk, all we have to do is make the 64 tell the Amiga what's on the disk. You could also go the other way if you wish.

For instance if you use an Amiga word processor and want to upload text onto a bulletin board using the Compunet modem, the way to do this is best summed up in one word. Async. (pardon?) Yes, Async.

Async stands for ASYNChronous communications, and is normally associated with sending and receiving data through the serial port. By this, I mean the RS232 port, not the Commodore serial bus, which is a

bastardised form of the IEEE-488 parallel standard.

Guess what? Commodore failed to implement RS-232C properly on the 64 and 128. Plus/4 owners are lucky in that respect as they have true RS-232 right up to 19K baud. So some sort of interface is needed. Examples of these can be found by looking through adverts in this and other magazines. I personally recommend the interface made by Brain Boxes (£49.95, 051-200-2500).

You will need to connect the RS-232 ports in a configuration known as a 'null modem' (fig. 1). Basically this makes each computer think it is driving a modem and not another computer. Refer to the computer's technical manuals for the pinouts of the serial ports.

Rather than writing your own software for transferring the files from one machine to the other, there is a public domain file transfer program available which makes it relatively easy.

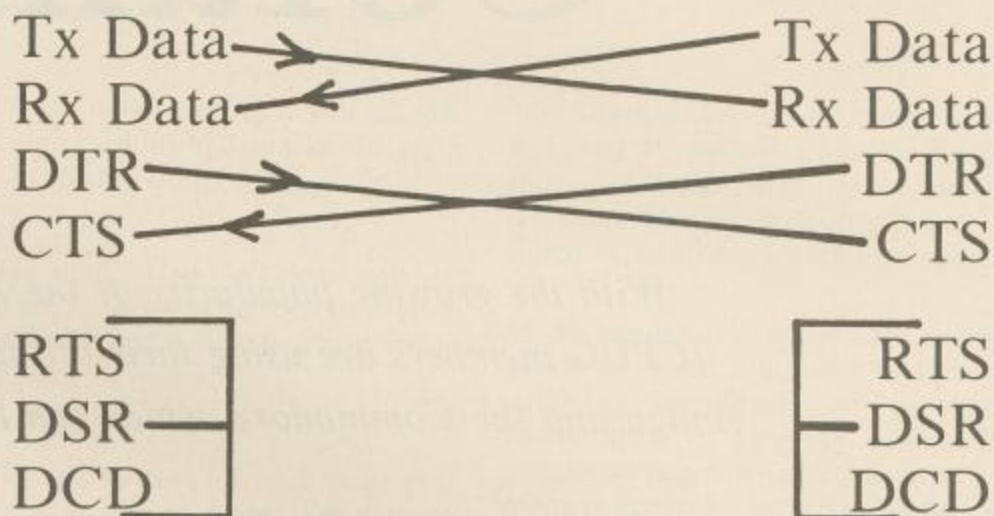

This is called 'Kermit', and is

available for virtually every personal computer under the sun. We certainly have it in all the ICPUG libraries. Before you ask, yes it was named after

a small and lovable green frog!

So, connect the cables, boot up the software, transfer the files and life will be easy. Or will it? YC

Games Reviews

Need some advice on the new releases? Then cast your eye over the latest batch of games.

Pegasus

You've flown a plane, taken a helicopter gunship for a spin, dived to the depths in a submarine and gone on patrol in a destroyer. Now here's your chance to fly across the waves in a hydrofoil.

This isn't going to be a joyride as you're at the controls of the PHM Pegasus. It's one of the heavily armed patrol boats like those on service with the NATO allies USA, Italy, and Israel and it's your job to complete one of the eight assigned missions. These range from target practice (although even these shoot back) to the highly topical but almost impossible job of escorting a supply ship from Kuwait, through the Persian gulf to the safety of the open sea! The only trouble is that the Gulf has become a war zone and ships are being attacked indiscriminately.

To carry out your mission you'll have to master the controls and weaponry of the Pegasus so you can react to any threat quickly and decisively. And at the same time, control the overall strategy of the mission as well as two search helicopters and the supply ships from a separate map screen.

The map screen is used to plot your course and speed as well as those for the helicopters and supply ship. Then you sit back and wait for the action. You don't have to wait long (you can speed up the game clock by 128 times normal speed) as enemy ships will soon be picked out by hydrofoil and helicopter radar screen. As soon as you see a blip you leap to manual controls and the instrument screen that shows fuel, speed, compass, radar and weapons gauges as well as a 3D view ahead and above that an enlarged binocular view of any locked on target. When the target is in range you can either take it out from a distance with a guided missile or try out your shoot skills with the 76mm water cooled naval gun. Either way you haven't got much time as other ships will soon be in the area.

Pegasus lacks some of the detail of other simulations such as Gunship and Silent Service, however it does compensate for that in action. Another recruit for your collection of combat simulations.

Black Magic

In a time of hapless warlocks and evil wizards, many moons before the civilised man came to be, class was a word not known and honour was judged by magical status. As you can imagine, it wasn't very nice being a normal person, being turned into a one eye'd dancing polar-bear, for the wizards amusement, and then left to dance around the village, only to be caught by the local fur coat maker - not very funny.

Anyway on with the real plot. You are, as it were, a normal person - a resident in the once peaceful village of Marigold.

The once lush green fields are now misty cemeteries where the bodies of Zargrim's (I'll come to him in a minute) victims are dumped. The towns are deserted and only the demons occupy the once happy homesteads.

This makes you very sad and angry (boo hoo) The last straw comes when Zargrim, the evil warlock of great power, kills your magic tutor, who taught you all that he knew. (Which wasn't very much as Zargrim had nicked all the magic books). So filled with anger you set off to kill the mighty Zargrim, but as you pack your rucksack you discover an old dusty parchment that tells the story of a wise old man called Anaker who was defeated by Zargrim and then had his six eyes nicked (yes, six) and placed randomly around the land so he could watch in vain as the land decayed and crumbled.

You decide to find Anaker's six eyes and place them back in the sockets (cringe). Anaker, by the way, has been turned into a statue, hidden away in the wilderness by Zargrim.

Well, what's the game like? Very good indeed, I haven't stopped playing it yet. Okay, the graphics are a little dodgy and sometimes dull, but the game is brill, with nice spot effects and a huge playing area. This type of game is new to me as I'm more of an arcade freak myself, but I just hope that US Gold make a follow-up to it, and then a follow up to that. Well, stop biting your toe nails and get this game, you won't be sorry.

K.R.

Touchline: *Black Magic*. **Supplier:** US Gold, Units 2-3 Holferd Way, Holferd, Birmingham B6 7AX. **Tel:** 021-536 3388. **Machine:** C64. **Price:** £9.99 (Ca)/£14.99 (Disk). **Originality:** 7/10. **Playability:** 9/10. **Graphics:** 5/10. **Value:** 8/10.

Centurions

Most of you kids out there must have seen that new American cartoon, The Centurions; those space-age super heroes who live high above the earth observing live on earth. And whenever something bad happens they beam down to our humble planet and zap the bad guys.

Well, it had to happen sooner or later didn't it - the cartoon of the toys of the game and so on. The idea behind

the game is this, the evil Doc Terror plans to get his slimy hands on a deadly nerve gas, which is hidden in the centre of a high security complex. Throughout the complex there are masses of doors which are all locked, and all need a special key to open it.

You and your centurion pals have to get into the complex's heart, locate the nerve gas and keep it safe from the Doc, sounds easy, doesn't it? Well I've seen the map for the level and it's huge, and one thing's for sure - it'll keep you busy for a long time.

At the start of the game you can choose one of the following characters - Jake, Ace and Max. Each have different skills, such as skills in the air, land and sea. You start off as a droid and must choose which skill you want.

Through-out the game there are patches of sea, air and land, in the middle of which are keys. So, if you are in sea mode and need a key that is surrounded by air (!) then you will have to go all the way back to the start and change your mode! The doors show which key is needed to open them by the keyhole, i.e. a door with a round hole will need a round key to open it.

This game is a little bit like Gauntlet where you can have two players involved at the same time. You can also collect various weapons as when you have shot a certain amount of nasties power-exoframes start to appear. On collecting these you are given a fruit-machine type chance to pick a weapon, press your button and a letter will be selected, with each letter being a different weapon and if you are lucky enough to get 'A' you will get extra strength and a random weapon.

Although there are only three ways to this game, they are so comprehensive that they are more than enough.

I wouldn't say this was a game for shoot-em-up freaks, as it involves a lot of thinking and memory, with a fair bit of blasting as well. Yet another playable and polished game from the main man Mr Crowther. Well, don't just sit there picking your nose, go and buy this game, it'll keep you busy for weeks on end.

Living Daylights

After the release of *View to a Kill*, I approached their latest title with an open mind. No doubt you have seen or at least heard of the new Bond film, the *Living Daylights*, if you haven't, sit tight.

You play the part of James Bond on a mission to rescue the lovely Kara and help a fellow agent General Koskov. But as you know, this will be no easy task.

You start the game in Gibraltar, training with the SAS. They conceal themselves behind rocks and jump out randomly and shoot you - don't worry though, it's only paint pellets. But somewhere on this level hides an enemy agent out to kill you, kill him and you will be taken to the next level.

Before entering the second level you are asked to choose a weapon from a list of four. Make sure you choose the right weapon though. Here it's just more of the same shoot-the-baddies, but not Joe Public - if you do shoot a passer by you'll lose points and a 'wheeeee' sound is played. This would have been better if when you shot an innocent person a blood curdling scream was heard (Friday the 13th style) and it would certainly put you off shooting any more Joes.

You play the game over eight levels, with increasing difficulty, but as I said before this game is almost the same all the way through. Just shooting jumping and dodging, but don't get me wrong, it's not a bad game at all, if it was a bit more varied, it might have got very high marks. But as it stands, it is a playable game that is let down by repetitive levels. It's a shame though, there were so many things that could have been put in, for instance a lively car chase with multiple weapons.

Oh well, there you have it, a great license that could have been brill, but unfortunately is only average.

Epyx Epics

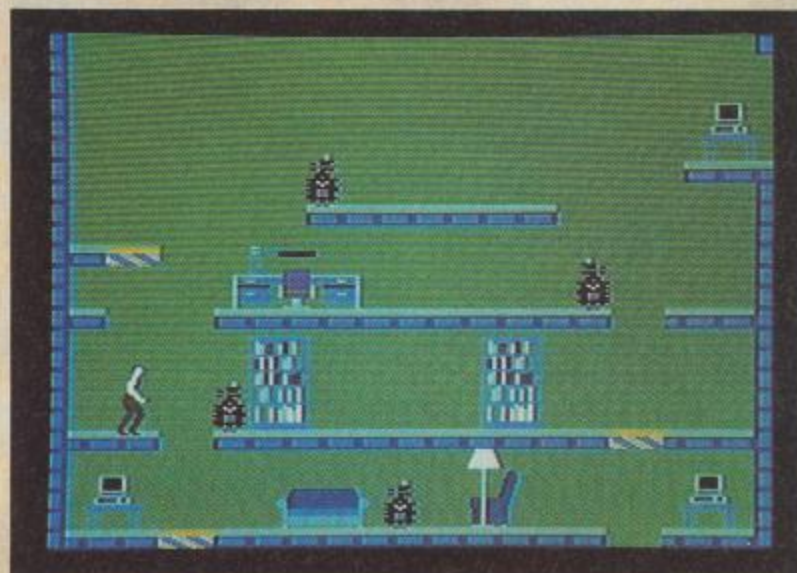

Whenever a magazine does a retrospective of great Commodore blasts from the past you can guarantee that *Impossible Mission* will be mentioned somewhere. Now you can add it to your collection and have *Summer Games*, *Pitstop II* and *Breakdance* added to the bargain. Yes, it's big value time from US Gold with their latest compilation *Epyx Epics*.

Few American companies can boast the string of successes enjoyed by this Californian team and, with the exception of *Breakdance*, this is a collection of their golden C64 moments.

I admit that *Pitstop* is perhaps showing its age, if only from the technical point that Grand Prix races no longer permit refuelling stops. As a racing simulation it still has the novel approach of fuel and tyre watching to recommend it over other Pole Position spin offs. In addition there are six real international circuits to choose from, either three, six or nine lap durations and three skill levels.

Playing at Pro level against the computer is almost impossible but you can always drag in a friend to play against you. Could *Pitstop II*'s re-release have something to do with bigger plans from US Gold? Watch this space...even better read the news pages.

In case you've forgotten, *Summer Games* is the one with

pole vaulting, diving, the crippling 4 x 400 metre relay, the 100 metre dash, gymnastics, freestyle swimming (100 metres and relay) and skeet shooting. Eight events in all to test your endurance, skill and speed. This is the one that started the Epyx sports craze which has now taken in *Summer Games II*, *Winter Games*, *World Games* and the new *California Games*. I hope we'll see the rest of them on compilations soon.

For me, *Impossible Mission* is the text book game. It has everything from simple but tricky gameplay through to the deeper level of puzzle solving. Add to this unsurpassed voice synthesis with magically animated graphics and I think you'll agree this is the ultimate. With rumours that *Impossible Mission II* will be appearing soon I may have to revise my opinions, but until then this is the showpiece.

Evil Elvin Atombender has a plan to destroy the world and several agents have been lost trying to foil his plot. Elvin

has locked himself away inside his underground stronghold and the coded keys to his hideout are scattered in pieces inside the furniture. Guardian robots will make sure that you won't get the codes easily as you race against time to defeat the mad professor.

When I first heard that Breakdance was being written I thought it would be awful but I was wrong – it's dull. A lot of effort went into trying to create an interesting game but it's basically a dance version of the Simple Simon music game.

There are four elements to the full game. In the first you match the moves of Hot Feet, the local hero. Then you try to outdance the Rocket Crew who try to dance you into the river. The third challenge is against the Breakdancing king and in the final phase you can build up your own dance.

At £9.99 for the collection, the relative cost per game is about £2.50. At this price it should be in everybody's library or you really are missing out.

Defender of the Crown

There I was, sorting the mail, press releases and final demands on payment for our editors hairdryer (on HP), when out of an envelope came Defender Of The Crown. 'Yeah, great' I shouted with glee and carefully stuffed it in the disk drive. After a few whirrs and clicks a nice title screen appeared with glistening metal and smart music. I knew then, I was in for a treat.

I'm sure most of you have heard of this game which grabbed the headlines of most magazines for its wonderful graphics and music.

The game is set in the 12th century in days of old when knights were bold and all that stuff. You can choose from a list of characters who are different skills i.e. some are good leaders but poor at sword fighting or could be good at

jousting but a grotty leader – it varies.

After the title screen and 'credits' have gone you will be asked to choose the character you want by pushing left and right on the joystick and a picture of the character and their abilities will be shown.

This done, it's on to the game. You are represented by a black shield on the map, which incidentally is where a lot of the game play takes place. You can transfer men from your home garrison to an army which you can place on a plot of land. When your move is over the computer then takes control of the other five players and so on.

Moves available to you are either to go raiding, where you can visit a local or not so local castle and attempt to steal their gold, but being of Saxon blood it's best to pick a Norman castle. First you have to fight your way past two guards, and if you have picked a poor swordsman you stand a good chance of losing.

I must mention the shadows that appear on the walls as you fight the guard inside the castle, as they are especially well done. You can also call tournaments provided you have the cash. After you call a tournament you are asked if you would like to joust for fame or for land. If you lose the battle and you choose fame your leadership rating will be reduced, or a piece of land lost depending on what you gambled for. If you do manage to win the joust you are greeted by cheers from the crowds and on your third win a nice little piccy comes up on screen showing you on your horse being presented with a prize from the King.

My favourite part of the game is the love scene. You are alerted by the wailing of a Saxon maid, and two options are available to you – either rescue or ignore her. If you manage to rescue her you will be greeted by an innocent-looking maid, who flutters her eye-lids at you. As you close in, she takes her clothes off (you'll go blind: ED) and last but not least you take her in your arms and give her a big smacker on the lips.

After that excitement you are then rewarded with her hand in marriage and the joining of the two kingdoms. However, if you ignore her, you are a coward.

My other favourite scene is the siege. Here (provided you have a catapult) you must attempt to knock down the enemies castle wall with boulders, but this is quite tricky as you have limited boulders and each shot fired is a day gone by. Disease and burning pots of molten goo are also on hand for reducing the enemies army, but to get them over the wall you have to shorten the wall. You will then go into battle and the player with the most men gets the castle.

All battle scenes and their outcomings depend on how many men you have and what strategies you use. You could try and outflank your opponent with your leadership or choose to just stand and fight among many other options.

Playing Defender of the Crown was a joy, there are so many options open that each game you play is almost different. The love scene for example is random – you never know when it's going to appear, so if you were out of cash, and a fair maiden needs rescuing it could be a good chance to bump up your readies. The graphics are also quite brath-taking and really build an atmosphere, though a lot of them are not animated. The music, well this is very good, loads of different tunes for each part of the game and very medieval too.

My only moan about the game is the various bugs which occur now and again. For example you could place five men in an army, then suddenly have twenty, but the small bugs

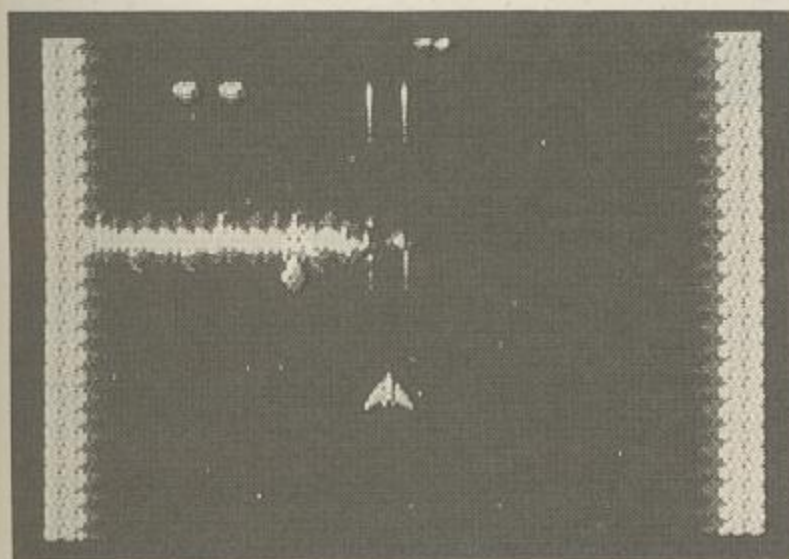

don't really spoil the game. It just gives the slight feeling that you are not in control of the game. However this is no reason not to buy the game, and quite frankly you would be a fool if you didn't.

Lazerforce

One thing you are guaranteed from a quality budget range is a good choice of shoot-em-ups. Code Masters latest game is a blockbusting blast consisting of several mini game parodies of old rave ups combined in a new and fresh way.

The rules are simple – survive! As the pilot of a delta winged starfighter you have to negotiate 32 levels of Hell, with each level consisting of four torture chambers.

The first challenge is reminiscent of a stage of Salamander, the arcade classic. Tongues of flame reach out to lick round your flavour-of-the-month craft. As the screen scrolls relentlessly down it reveals an amazing assortment of gun fodder attacking in myriad ways. From behind come the backward firing attackers; mean machines who care little for obstructions in their path. It's all happening at once; it's hot, sticky, frantic action. Make contact with a WOP (who he?), your double fire power is increased to triple power and you can really give the enemy a roasting.

Another weapon in your armoury is the Energy Divergence Bomb which destabilises the kinetic energy of the alien craft and vapourises them all. Your store of EDBs is limited so use them wisely.

Assuming you survive, you meet the Guardian Zone, which is a Centipede style game, only four times more fiendish. Still the attack waves descent towards your small sweatpit of a ship but now centipedes appear spiralling down towards you through the mushroom shaped space debris. Here again you can enlist the use of WOPS and EDBs.

Now the calm comes after this storm as you dock with your mothership to refuel and gain bonus points for success.

These points can be increased as you pass through the convoluted tunnel. If you crash in either of these phases you will not lose a life, so be as daring as you like.

Here endeth the first level and although the rest of the game follows the same pattern the style changes. Level Two starts with mechanical arms reaching out and blocking your path, making you swerve like crazy to avoid collision. Level Three has bubbles which don't move but have to be dodged around as you zip along on your way.

Lazerforce is the best game of its type that I have seen in a long time. If Jeff Minter wants to relinquish his crown as King Zap, Gavin Raeburn is a worthy successor. So much for so little, what a bargain!

The Astonishing Adventures of Mr Weems and The She Vampires

At first glance there is more than a passing resemblance between this game and Electric Dreams' Dandy. Not surprising really because they're both sourced by the popular but ever so slightly whacky Ram Jam Corporation. This bunch have been on the games scene since the year dot; for the most part hiding behind larger companies such as Electric Dreams and Mosaic, but this time working for Piranha.

Mr Weems is set in the distant past when there were two kinds of living dead – Vampires and Chartered Accountants. The only similarity between these breeds is their blood-sucking ways. Nowadays there are only CA's and this game provides a possible answer to the question of how the Vampires went into a decline.

Weems is not a run-of-the-mill accountant, he is a failed run-of-the-mill accountant. After flirting with a heady

alternative career as a lion tamer, circus life lost its bite and so he turned to vampire hunting. Armed with a rapid-fire garlic gun and a single smart garlic pill we join our dull little friend in his greatest moment.

Deep in a Transylvanian chateau the She Vampires and their cohorts are out for blood as they stalk Mr Weems. Nonchalantly, Weems blasts bats, Frankenstein monsters and minor She Vampires with the same kind of detached indifference which he adopts when he tots up rows of figures in Company ledgers. This time it's his blood count which interests him, if it falls to zero so does he!

Hidden around the enormous house are keys to rooms and secret passages. Vials of precious blood will replenish his failing health and garlic bombs help to clear screen-upon-screen of fiends.

Weems can blast away the corpusele consumers permanently if he clears away all of the nasties in a particular area. This renders the evil-generating tombs vulnerable to his attacks. Each tomb-free room becomes permanently exorcised, but just one unscathed generator will breed more creatures of the night when Weems returns.

After eradicating five floors of demons, Weems faces the wrath of the Great She Vampire. If he has the tools he'll finish the job, if he is ill-equipped the She Vampire will prevail.

At first I thought this was just another Gauntlet clone but it has a uniqueness which won me over in the end. On the credit side, the game possesses that cut and come again appeal which the frantic original failed to deliver. In the debit column is the Spectrum style of graphics (but not as ghostly ghastly as Dandy).

I think the similarity between Dandy and Mr Weems may have an adverse effect on sales that even a silly title will fail to counteract. The cover illustration wins my vote as the worst I have seen in a long time. A shame really because Mr Weems shows a vast refinement of style over its predecessor and deserves to win a larger audience.

Mermaid Madness

Once upon a time there was a really ugly, old, cabbage-faced mermaid called Myrtle, who thought that at the ripe old age of a hundred and ten, she would be left on the shelf. So there she was sitting on the pier feeling sorry for herself, when up comes a deep sea diver by the name of Careless Colin. With stars in her eyes she decides that this is her man and promptly tries to grab him. Colin may be stupid, but not that stupid and he dives quickly off the pier to avoid her open arms. Foolishly however, he hides under a wrecked boat and gets trapped. Myrtle the Mermaid is horrified and sets out to rescue Colin.

This is where you take over - you must guide Myrtle, who

can walk on land as well as swim in the sea, who will need to collect various objects, in order to progress. For example, you must find the dynamite to blow up rocks that block your path, find the use for the strange ankhs, and collect bottles of stout to keep your energy levels up. Also you have to keep an eye on your heart, as this beats faster the closer you get to Colin.

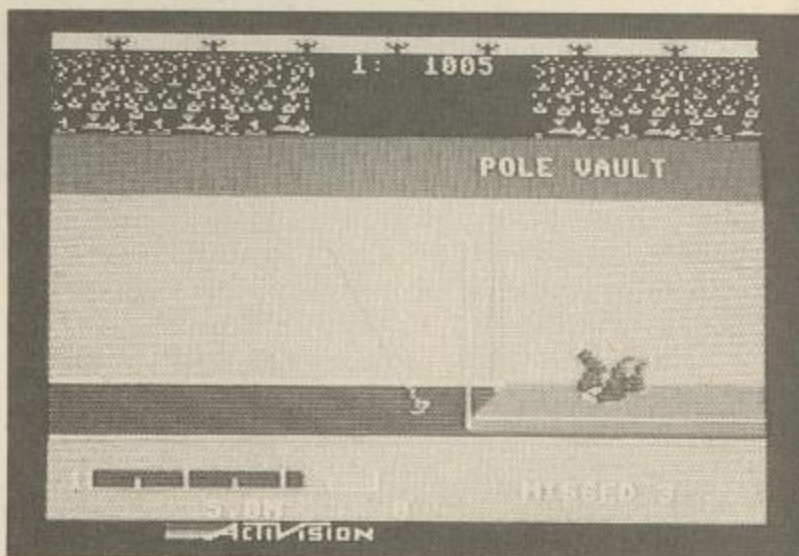

There are various sea creatures through-out the game and any contact with these will reduce your energy little by little.

If you do not already have this game (it was released a while back by Electric Dreams) then go out and get it, as for £1.99 it's good value. I must mention the music which is also quite jolly.

Touchline:

Title: *Mermaid Madness.* **Supplier:** Firebird, 64-76 New Oxford Street, London WC1A 1PS. **Price:** £1.99. **Originality:** 8/10. **Playability:** 6/10. **Graphics:** 7/10. **Value:** 7/10.

Decathlon

Joystick waggling can prove to be a very tiring affair. This is especially true when you have to keep it up for some four

minutes non-stop in order to compete in the 1500 metres, the last event in the Decathlon. Originally released by Activision, Firebird have given the game a new lease of life at a budget price.

The events can be divided roughly into two sections – brute force and timing. There are three running events; 100, 400 and 1500 metres and you must keep the joystick moving from side to side just as fast as your hands will let you. In the other events, not only must you run up quickly, but you have to press the fire button to jump or throw.

Up to four players can take part simultaneously either in all ten events or just one. Points are awarded on the basis of your performance – the longer you throw the javelin, the better you score and as in real life, you soon discover that different people have different strengths and weaknesses.

Graphically, the game looks crude but that is irrelevant. Decathlon plays superbly. It was one of the first multiple-event type of game to be released and still stands the test of time. Superb value at under two pounds.

Clean Up Service

Mr McSween, owner of the Addle Hotel has a little problem which is so bad, he can't keep his staff for long. What he needs is a hard-working person who can restore normality and the Hotel's reputation. Instead he employs Otto and Bobban, a pair of shirkers desperate for work after their exploits in Clean Up Time.

The instructions to this offering are non-existent, a deplorable habit which is common in the budget world. It took some time before I could work out what the game was all about. It was only when I discovered that there is a box of goodies on the screen that I started to understand the nature of the game. By rummaging in the box you find a gun, a

brush and a bin lid which help to eradicate the litter louts who run from floor to floor.

In the impossibly difficult one player game Bobban sleeps upstairs as Otto dashes about in a futile attempt to rid the hotel of louts. The two player version brings Bobban into battle and the possibility of success becomes more feasible.

The louts emerge from several bins in the hotel, and the first task is to select which bin it is best to close to keep the louts at bay. Once a lid has been placed on the bin the real clean up begins.

Armed with the gun and a brush the team can limit the amount of litter the louts spread until all the rubbish is removed. On subsequent levels the creatures and the aims change – in the kitchen make a hamburger, go fire fighting, and beat the witch. In all, there are eight levels, more than enough for an excellent value budget game.

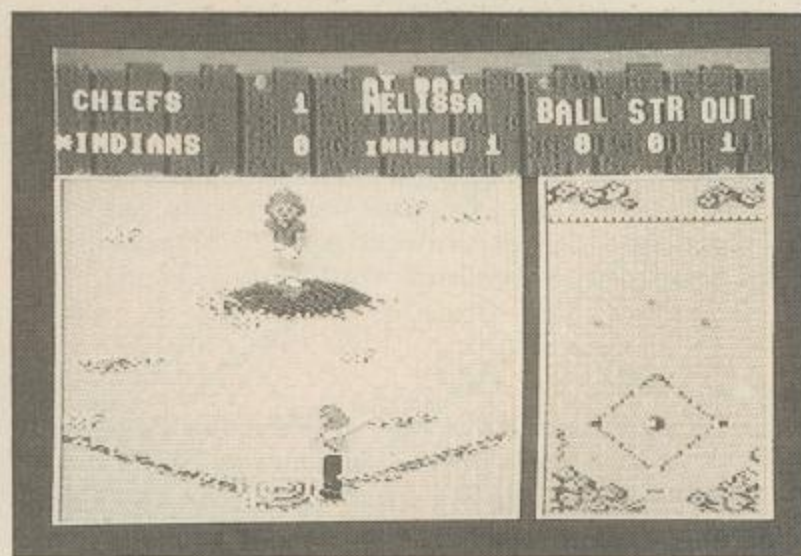

This is a graphically interesting game and, in two player mode, the game is tricky, challenging and enjoyable. As a one player game it's a non-starter. If your social group includes another computer freak with his own joystick you could do a lot worse than to buy this co-operation game. If you are a secret Commodore basher avoid Clean Up Service at all costs.

Street Games – Baseball

If you're anything like me your experience of baseball games would be one of battling against the odds, and considering a twenty to seven defeat as being a pretty good achievement.

Epyx Street Sports version of baseball from US Gold is the exception to the rule, allowing plenty of interaction before and during the game. There is plenty of opportunity to improve your team's performance and the excellent graphics and gameplay make it the best simulation that I've seen so far.

There are sixteen kids on 52nd Street and all of them want to play. As captain you have to use your skill to select the best possible team. Each captain takes a turn and then you have the option of selecting your own batting order and field positions before the game begins.

None of the kids are great all-rounders and this makes the team selection a fascinating part of the game. Julie, for example, throws better than most of the boys on the team, but is lousy when it comes to batting. David, on the other hand, bats like a demon but makes a second-rate fielder. The skill of choosing is to select a team which covers its own failings as far as possible.

When the actual game begins you have a large degree of control over the action. You even choose whether you play on tarmac or grass. When batting, your only worries are when to hit the ball and when to leave it alone. Timing of your stroke is important and not too difficult to master because you are given perspective and overhead views.

These two views are especially useful when it's your turn to pitch. The ball can be swerved using the joystick in the most unnatural ways. A double swerve, or 'S' shaped pitch, is possible and useful for confusing the opposition. The speed of the ball can vary too. It might start as a slow pitch, but suddenly you can make it pick up speed as it nears the batting plate.

The main screen goes wherever the action lies. If the ball is flying towards the outfield you are shown the landing zone and it's up to you to move your nearest fielder into the zone ready for the pickup. Being backstreet baseball there's plenty of rubbish for the fielders to trip over. Some of the players are not so good at straight catches let alone tackling an obstacle course!

The graphics are brilliant. Special attention has been paid to colourful and realistic animation but the sound is sparse though quite inventive. You even get the occasional car horn blaring away in the background.

During a game you really get to know the players quite well, and the next time you load the game you can select different teams or try different batting or fielding positions. This is a superb game and well worth its price.

Jackle & Wide

Dr. Jackle has at long last perfected his transformation potion. Eager to see if it works, he takes a quick gulp and finds that he has a success on his hands. Well, not quite, as there are two slight problems. Although he has been transformed, the person that he has become, Mr. Wide, is not exactly the sort of person that you would like your granny to meet. In fact, he is thoroughly evil. The second problem? In your haste to try out your new option, you accidentally forgot to prepare an antidote.

There is only one course of action left to you. You must seek out the laboratory of your arch rival Dr. Piqued, hidden somewhere beneath Hyde Park. As he was working on the same problem, he might be able to provide the antidote.

The game is a problem solving arcade adventure in the format of wandering round, and picking up various items and using them to help you get past various obstacles. As such, it is no better or no worse than the hundreds of other games of this type but is not bad value at under two pounds.

G.R.H.

ACE 2

Ace is not only the sequel to the popular ACE combat flight simulator but also includes a second player and a second plane into the action.

The action takes place just off the coast of a foreign power where one player is based on an aircraft carrier sent to monitor a radar base. The land-based player takes exception to this and although the ship is in international waters a plane is sent out to intercept. Flyer one launches its carrier based plane to intercept the other plane and destroy the radar station.

Before you take to the skies you can set up the game by tweaking parameters that decide the number of planes each player has, the number of hits required to blast each plane and the skill of the computer opponent if you can't find a human that can stand the pace.

You can arm your aircraft with a selection of close range heat seeking missiles and longer range radar guided missiles to dogfight with your opponent and also air to ground missiles to take out the carrier of the radar base. Unfortunately you can't carry everything you need all at once so you have to decide which weapons you need first.

As with any dogfight game you are in control if you're on his tail. Get in range and you can cut him down with a succession of missiles and then finish him off with cannon fire. However, he is trying the same tactics so you should be ready to take evasive action if he fires at you. This action can either involve rapidly changing your speed, direction and height, or firing a flare or chaff to confuse the missile.

The action is fast and frantic as daring manoeuvres must be carried out at top speeds. ACE 2 is a worthy successor to ACE and is certainly set to become a high flier.

T.H.

TOTAL BACK-UP POWER CBM 64/128

PERIPHERALS..THE FINAL FRONTIER..OUR MISSION..TO BOLDLY
GO WHERE NO OTHER UTILITIES HAVE GONE BEFORE

CAPTAIN'S LOG...THE TOTAL SOLUTION TO ALL YOUR BACK-UP NEEDS... THE ULTIMATE BACK-UP CARTRIDGE HERE NOW !!

REPORT ON FINDINGS

Action Replay Mk III is more powerful, more friendly and will back up more programs than any competing utility by taking a 'Snapshot' of the program in memory so it doesn't matter how it was loaded... from disk or tape, at normal or turbo speeds... the results are the same - Perfect!! Amazing!!!

STARBASE UPDATE

- Simple to use: just press the button and make a complete backup: Tape to Tape, Tape to Disk, Disk to Disk, Disk to Tape. - THE PROCESS IS AUTOMATIC - JUST GIVE THE BACKUP A NAME.
- All backups will reload at turbo speed independently of the cartridge.
- Dual speed tape turbo system. Programs can load up to 3 times faster than commercial turbos - that's over 10 times normal Commodore speed.

- Freeze the action then view the program with the monitor feature. Add pokes for infinite lives etc. Then restart the game or backup - ideal for customised versions of your games.
- Picture Save. Save any multi-colour, Hires screen to disk or tape. Compatible with Blazing Paddles, Koala, Slideshow etc.
- Fully compatible with 1541, 1541C, 1570, 1571, and ehancer or any CBM compatible data recorder.
- For C64, 64C, 128, 128D (in 64 mode).
- Unique Sprite Monitor. Freeze the Action and view all the Sprites, watch the animations scroll across the screen. Save Sprites to disk or tape. Customise your games by loading sprites from one game to another - then restart the program or make a backup.

- Compatible with fast DOS and Turbo ROM systems.
- Backup process in turbo speed - faster than any rivals.
- Special compacting techniques. Each program is saved as a single file.
- Transfers multistage tape programs to disk - more than any other cartridge - even the extra stages are turbo load - a unique feature.
- Sprite Killer! make yourself indestructible by disabling Sprite collisions in games.
- Fast disk format (20 secs).
- Built-in unstoppable reset button.

**ACTION
REPLAY
MK III**

PLUS Built In FASTLOADER

Action Replay III even has a built in disk fast loader which speeds up loading 5 times. Uses no memory - invisible to the system. You could pay £20 alone for this feature.

WARP 25 BREAKS THROUGH THE 10 SECOND BARRIER!

Action Replay III now comes with an amazing new Disk Bootloader that will reload your backups at TWENTY FIVE TIMES normal speed. The fastest disk turbo yet devised!! There are NO CATCHES. WARP 25 works with ALL your games. Works with any disk drive. No pre-load required - No hardware modifications necessary - No user knowledge required - programs load INDEPENDENTLY. LOADING TIME - 9.8 SECONDS (for a typical game saved by WARP 25 in conjunction with ACTION REPLAY III). This time is for the COMPLETE load process from start to finish. Reload is entirely INDEPENDENT of the cartridge or any other hardware. Compare these (accurate!) figures for some rival backup systems:

SYSTEM	LOAD TIME	PROGRAMS PER DISK	CARTRIDGE REQUIRED?
ACTION REPLAY MK III SAVED WITH NORMAL TURBO	25 SECS	THREE	NO
ACTION REPLAY MK III SAVED WITH WARP 25	9.8 SECS	THREE	NO
FREEZE FRAME (MK IV)	40 SECS	TWO OR THREE	NO
FREEZE FRAME (LAZER)	25 SECS	TWO	YES
EXPERT SYSTEM	30 SECS	THREE	NO

All purchasers of Action Replay III will receive WARP 25 FREE with their cartridge. Existing Action Replay III owners can obtain WARP 25 Disk turbo by sending £2.50, post free. (No need to send your cartridge). OR obtain it FREE on the Enhancement Disk (£7.95).

THE ACTION REPLAY ENHANCEMENT DISK

The best collection of tape to disk transfer routines for nonstandard multiloader programs (eg Dragons Lair I and II, Championship Wrestling, Summer Games, Ace of Aces, Gauntlet, Supercycle, Marble Madness, World Games), 31 titles in all. Uses our unique parameter system. No user knowledge required. Turbo load throughout. NOTE: Standard cartridge transfers normal multiloaders eg Winter Games etc. etc. Disk includes the copy and disk backup utilities. PRICE £7.95 with FREE Multicolour Slideshow for display of loading screens, hires pictures etc. saved by Action Replay. Great entertainment!

PERFORMANCE GUARANTEE

100% Success? Rival Claims? Who's Kidding Who? Action Replay Mk III will backup any program which any other cartridge can backup - and more! It also has an unmatched range of features. Consider 'Freeze-Frame' for example, which uses more disk space, saves at slower speed, has slower tape loader, has no built in disk fastloader, no picture, Sprite or restart features and costs £10 more than Action Replay. So who's kidding who? Buy Action Replay Mk III. If you find that it does not live up to our claims return it within 7 days of receipt and your money will be refunded.

USUALLY SAME DAY DESPATCH ON ALL ORDERS.

DATTEL ELECTRONICS

3 SLOT MOTHERBOARD

Save wear and tear on your Expansion Port

- ☐ Accepts 3 cartridges.
- ☐ Onboard safety fuse.
- ☐ Switch in/out any slot.
- ☐ High grade PCB.
- ☐ Fully buffered.
- ☐ Reset button.

ONLY £16.99

DATA RECORDER

- ☐ Quality Commodore compatible data recorder.
- ☐ Pause control.
- ☐ Suitable for 64/128.
- ☐ Counter.
- ☐ Send now for quick delivery.

ONLY £24.99

SMART CART™

Now you can have an 8K or 32K cartridge that you program like RAM then acts like ROM!

- ☐ 8K or 32K pseudo ROM.
- ☐ Battery backed to last up to 5 years (lithium battery).
- ☐ Simply load the program you require — then flick the switch. The cartridge can then be removed just like a ROM cartridge.
- ☐ Make your own cartridges including autostart types — without an EPROM burner.
- ☐ Can be switched on or off board via software.
- ☐ 1/0 2 slot open for special programming techniques.
- ☐ 32K version has 4 x 8K pages.
- ☐ Some knowledge of M/C is helpful — but full instruction are provided.

8K VERSION £14.99

32K VERSION £29.99

SMARTCART UTILITIES

A series of utility programs for use with Smartcart. Simply load in the program and you have a powerful cartridge. When you have a different requirement — load in another program and you have a new cartridge. The process takes seconds, and can be repeated any number of times.

We intend to release a range of programs. The first available are:

DISKMATE II

☐ all the features of Diskmate II (see ad). Loaded in seconds — with full instructions. **ONLY £9.99**

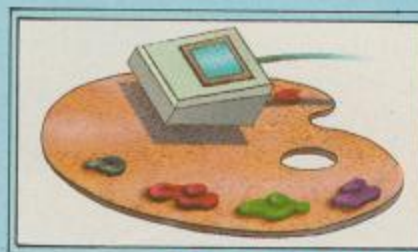

PRINTER IV

Now you can turn your MPS 801 into 4 printers in one!!

- ☐ Alternative character set ROM — fitted in seconds.
- ☐ All four sets have true descenders.
- ☐ 100% compatible with all software.
- ☐ Descender: ☐ Eclipse.
- ☐ Scribe. ☐ Future.
- ☐ Choose any set at the flick of a switch.

"For anyone who uses their printer often this chip is a must. It's quick and easy to use and the end results are impressive" — Your Commodore, Jan 87.

ONLY £19.99

BLAZING PADDLES

A complete lightpen/graphics illustrator package.

- ☐ A fully icon/menu driven graphics package of a calibre which should cost much more.
- ☐ Complete with a fibre optical lightpen system for pin point accuracy.
- ☐ Multi feature software including:
 - Range of brushes • Airbrush • Rectangle • Circle • Rubberbanding • Lines • Freehand
 - Zoom mode • Printer dump • Load/save • Advanced colour mixing — over 200 hues!!
 - Cut and paste allows shapes/windows/pictures to be saved to/from tape/disk.
- ☐ Blazing Paddles will also work with many other input devices including: Joysticks, Mice, Graphics Tablets, Trackball etc.
- ☐ Pictures can be saved from Action Replay and edited with Blazing Paddles.

Complete Blazing Paddles & Lightpen **ONLY £24.99**

Blazing Paddles available separately for **£12.99**

TOOLKIT IV

The ultimate disk toolkit for the 1540/1541

- ☐ A disk toolkit is an absolute must for the serious disk hacker. Toolkit IV has more features than most for less.
- ☐ DISK DOCTOR V2 — Read and write any track and sector including extra and renumbered tracks. Repair damaged sectors. Look underneath read errors.
- ☐ HEADER/GAP EDITOR — Decodes and displays ALL header information including off bytes and header gap. Rewrite the entire header and header gap. Renumber sectors. Also edit any sector tail gap.
- ☐ DISK LOOK — Sort directory. Recover lost files. Display file start/end addresses. Disassemble any file program directly from the disk to SCREEN or PRINTER including undocumented opcodes. Edit Bam. Much, much more.

RAM DISK

- ☐ Turn your Smart Cart into a 32K RAM/disk.
- ☐ 32K of instant storage area for files/programs.
- ☐ Load/save instantly.
- ☐ Disk type commands: load, save, directory, scratch.
- ☐ Program data retained when computer is switched off!
- ☐ Full command set with instructions.

ONLY £9.99

TURBO ROM II

Turbo Rom II is a replacement for the actual kernal inside your 64. It provides superfast load/save routines.

- ☐ Loads most programs at 5-6 times normal speed.
- ☐ Saves at 5-6 times normal.
- ☐ Improved DOS support including 10 sec format.
- ☐ Programmed function keys: load, directory, old, etc.
- ☐ Return to normal kernal at flick of a switch.
- ☐ PCOPY — 250 block file copier.
- ☐ FLOAD — special I/O loader.
- ☐ Plus lots more.
- ☐ Fitted in minutes — no soldering usually required. (On some 64's the old ROM may have to be desoldered).

ONLY £14.99

DIGITAL SOUND SAMPLER

- ☐ The new sampler allows you to record any sound digitally into memory and then replay it with astounding effects.
- ☐ Playback forwards/backwards with echo/reverb/ring modulation etc.
- ☐ Now with full sound editing module to produce outstanding effects.
- ☐ Full 8 bit D to A and ADC conversion.
- ☐ MIDI compatible with suitable interface. (I.e. Datel unit for £29.99, see ad).
- ☐ Live effects menu includes real time display of waveforms.
- ☐ Line in/mic in/line out/feedback controls.
- ☐ Powerful sequencer with editing features.
- ☐ Load/save sample.
- ☐ Up to 8 samples in memory at one time.
- ☐ Tape or disk (please state).
- ☐ Complete software/hardware package **£49.99**
- ☐ Com-Drum software is available separately at **£9.99** to turn your Sampler II into a Com-Drum system as well as a sampling system.

COM-DRUM Digital Drum System

- ☐ Now you can turn your computer into a digital drum system. ☐ Hardware/software package.
- ☐ 8 digital drum sounds in memory at one time.
- ☐ Complete with 3 drum kits.
- ☐ Real drum sounds — not synthesised.
- ☐ Create superb drum rhythms with real and step time. ☐ Full editing. ☐ Menu driven.
- ☐ Output to hi-fi or through tv speaker.
- ☐ Load/save facilities. (state tape or disk)

ONLY £29.99

COM-DRUM EDITOR

- ☐ 24 drum sounds supplied on disk to enable you to construct your own drum kit.
- ☐ Re-arrange sounds supplied with a Com-Drum to make new kits.
- ☐ With sound sampler hardware you can record your own kits. ☐ Load/save facilities.

ONLY £4.99 disk only

ROBOTEK 64

Model & Robot Control made easy

- ☐ Robotek 64 is a comprehensive hardware/software package which enables you to connect your 64/128 to the outside world.
- ☐ 4 output channels — each with onboard relay
- ☐ 4 input channels — each fully buffered TTL level sensing.
- ☐ Analogue input with full 8 bit conversion.

- ☐ Voice input for voice control.
- ☐ Software features: test mode/analogue measurement/voice activate/digital readout etc.
- ☐ Excellent value! **ONLY £39.99**

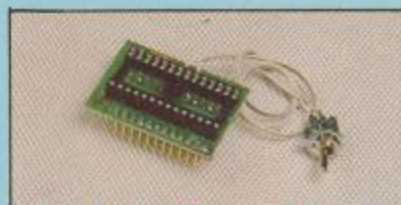

including hardware/software/mic etc. (State tape or disk)

DATTEL ELECTRONICS

256K SUPEROM EXPANDER

- ☐ Now you can select from any of 8 32K EPROMs instantly.
- ☐ 8 sockets to accept up to a 32K EPROM in each.
- ☐ On board operating system — no programs to load.
- ☐ Program your own EPROMs using our EPROM programmer.
- ☐ No need to have loads of cartridges — just make a selection from the Superom menu.
- ☐ Directory of utilities on power up.
- ☐ Fully menu driven on power up.
- ☐ Select any slot under software controls.
- ☐ Unique EPROM generator feature will take your own programs — basic or m/c and turn them into autostart EPROMs. (EPROM burner required).
- ☐ Accepts 2764/27128/27256 EPROMs.
- ☐ On board unstoppable reset.

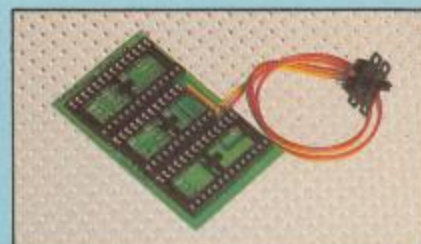

ONLY £29.99

4 WAY KERNAL BOARD

- ☐ This board fits in place of the kernal in your 64 and accepts a 16K or 32K replacement kernal giving 2 or 4 different operating systems.
- ☐ Just flick the switch supplied to select between systems.
- ☐ This is a carrier only — ready to accept your own chip.
- ☐ Now you can have all your different systems available at one time.
- ☐ Full instructions. ☐ Fitted in minutes.

ONLY £8.99

5 WAY KERNAL EXPANDER

- ☐ A multi carrier board accepts up to 3 chips.
- ☐ Fits in place of original kernal of 64.
- ☐ Three sockets — one for the original kernal plus two others each accepting a 16K chip — that's 5 operating systems available at the flick of a switch!
- ☐ Fitted in minutes.
- ☐ Full instructions.

ONLY £12.99

RESET CARTRIDGE

- ☐ Unstoppable reset button.
- ☐ Resets even so called "unstoppable" programs.
- ☐ Add poles from magazines etc.
- ☐ Fits in cartridge port.
- ☐ Simply plug in.

ONLY £5.99

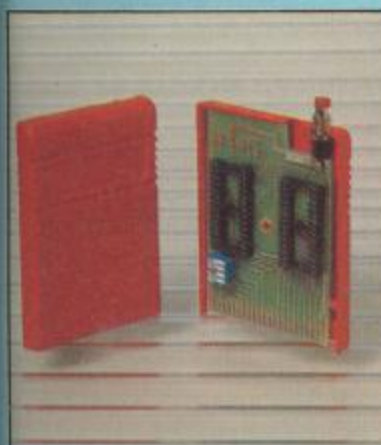

QUICKSHOT TURBO™

- ☐ Top quality fast action.
- ☐ Top & trigger fire buttons.
- ☐ Rapid fire/auto action.
- ☐ Suction feet for one handed action.
- ☐ Extra hardwearing.

ONLY £12.99 for 64/128

ONLY £13.99 for C16

16K EPROM BOARD

- ☐ Accepts 2 x 8K EPROMs.
- ☐ Switchable to configure as 2 x 8K or 16K or off.
- ☐ On board unstoppable reset.
- ☐ Full instructions.

ONLY £8.99

DISK NOTCHER

- ☐ Quickly and easily double your disk capacity.
- ☐ Use both sides of your disks.
- ☐ Simple to use.
- ☐ Takes seconds.

ONLY £4.99

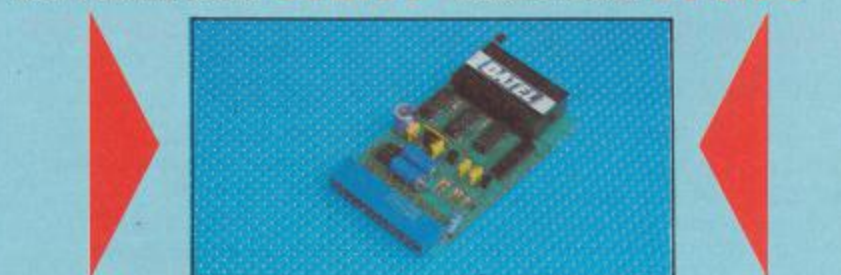

DEEP SCAN BURST NIBBLER™

- ☐ The most powerful disk nibbler available anywhere, at any price!
- ☐ Burst Nibbler is actually a two part system — a software package and a parallel cable to connect the 1541/1570/1571 to 64/128 (state type).
- ☐ What gives Burst Nibbler its power? Conventional nibblers have to decode the data from the disk before it can transfer it using the serial bus — when non standard data is encountered they are beat. Burst Nibbler transfers data as raw GCR code via the parallel cable without the need to decode it so you get a perfect copy of the original.
- Will nibble upto 41 tracks. ● Copy a whole disk in under 2 minutes. ● Full instructions.
- Regular updates — we always ship the latest. ● Fitted in minutes — no soldering usually required.
- Full or 1/2 tracks. ● No need to buy parallel cable if you have Disk Demon/Dolphin etc.
- Cable has throughbus extension for other add ons.

☐ Whether to choose FastHack'em or Burst Nibbler? Fast Hack'em is unbeatable value as an "all-rounder" — with nibblers, 1 or 2 drive copy, format, file copy, 1571 copy etc. etc., so if you have a more general requirement perhaps FastHack'em is for you. Burst Nibbler is a pure nibbler second to none, for the reasons stated. So if it's just making backups you are interested in, there is no other product to beat it.

ONLY £24.99 COMPLETE

SOFTWARE ONLY £12.99 CABLE ONLY £14.99

EPROMMER 64™

- ☐ A top quality, easy-to-use EPROM programmer for the 64/128.
- ☐ Fully menu driven software/hardware package makes programming/reading/verifying/copying EPROMs simplicity itself.
- ☐ Will program 2716, 2732, 2764, 27128 and 27256 chips. 12.5, 21 or 25 volts.
- ☐ Fits into user port for maximum compatibility with cartridges/Superom Board etc.
- ☐ Full feature system — all functions covered including device check/verify.
- ☐ We believe Eprommer 64 is the most comprehensive, most friendly and best value for money programmer available for the 64/128.
- ☐ Ideal companion for Superom Board, Cartridge Development System, our kernal expanders or indeed any EPROM base project.
- ☐ Comes complete with instructions — plus the cartridge handbook.

ONLY £39.99 COMPLETE

DATTEL ELECTRONICS

PROFESSIONAL DOS™ MIKROTRONIC £64.99 POST FREE with Disc Demon operating system "The world's tastest parallel operating system"

- ☐ Loads a typical 202 block program file in under 3 seconds!
- ☐ 60x faster load (PRG files).
- ☐ 25x faster load (SEQ files).
- ☐ 20x faster save (PRG files).
- ☐ 20x faster save (SEQ files).

PLUS AN ADVANCED COMMAND STRUCTURE INCLUDING:

- ☐ Fast format - up to 40 tracks (749 blocks).
- ☐ 16 function keys: list, run, load, directory, format, save, old, verify, etc.
- ☐ Flood will fastload files up to 250 blocks (other similar systems will only cope with 202 blocks).
- ☐ Number conversion. ☐ Reset.
- ☐ Unique built in file copier will copy files up to 250 blocks like lightning - multiple copy options - perfect for copying Action Replay files.
- ☐ Highly compatible with commercial software - can be switched out for non compatible programs.
- ☐ Perfect for use with Action Replay 3 - a typical AR3 backup will reload in about 3 seconds - yes 3 seconds!
- ☐ Speeds up other DOS functions including verify, scratch etc.
- ☐ Comes complete with superfast file and whole disk copier free!
- ☐ Screen on or off during loading.
- ☐ Enhanced command set - over 30 new commands.
- ☐ Easily fitted - Disk Demon plugs inside the 1541 and the new operating system chip plugs inside the C64/128. Fitting takes only minutes and usually requires no soldering.
- ☐ User port throughbus supplied free - you could pay \$15.00 for this alone.
- ☐ Supplied complete - no more to buy.
- ☐ Works on C128/1541 in 64 or 128 mode.

FAST HACK'EM™

The Ultimate Disk Copier/Nibbler for C64/128

C128 version
£69.99

- ☐ MULTI-MODULE SYSTEM - ALL ON ONE DISK
- ☐ SINGLE 1541 MODULE
- AUTO NIBBLER: Copy an entire protected disk in 3 minutes. Automatically senses type of protection and treats it as normal data to produce working copy.
- NIBBLER: Copy an entire disk in 2 minutes. As above but parameters can be set manually.
- FAST COPY: Copy a disk in under 2 minutes.
- FILE COPY: Copy and file in 9 seconds.
- ☐ 1541 PARAMETERS MODULE

This is the module that gives Fast Hack'em its power. The parameters module contains dozens of "Parameter Keys" that are used to unlock those heavily protected programs. Each parameter is designed for a particular software brand or even a particular program. Other copy programs may make strong claims, but without special parameters they just can't cope. Datel will be offering updates to Fast Hack'em on a quarterly basis, featuring 20-50 new parameters plus other improvements as they're made. Prices to be £6 plus old disk.

1541 PARAMETERS MODULE

- AUTO NIBBLER: Copy an entire unprotected disk in under 1 minute. Features auto track/sector analyzer.
- FAST COPY: Copy entire disk in 36 seconds with verify.
- AUTOMATIC FASTCOPY: As above but with completely automatic operation. In fact once set up doesn't even need the computer. A must for duplicating disks on a large scale.

ONLY £19.99

DISKMATE II

The Disk Utility Cartridge

- ☐ Disk fastload cartridge.
- ☐ Up to 5 times faster.
- ☐ Fast save. ☐ Fast format (10 secs).
- ☐ Improved DOS - single stroke commands - load/save/dir/old etc.
- ☐ Redefined function keys for fast operation of common commands.
- ☐ Powerful toolkit commands including: old/delete/merge/copy/append/autonum/linesave etc.
- ☐ Plus a full machine code monitor - too many features to list but it has them all!
- ☐ Special switching techniques make Diskmate invisible to the system. Therefore it is a more compatible fastloader than other types.
- ☐ Diskmate II is \$14.99.

Special Offer!!

Diskmate II can be purchased on the same cartridge as Action Replay III for **ONLY £39.99**

MIDI 64

A Full Midi Interface for the 64/128 at a realistic price

- ☐ MIDI in. ☐ MIDI thru. ☐ 2 x MIDI out.
- ☐ Compatible with most leading software packages including: Seil, JMS, Advanced Music System, Joreth, Steinburg etc.

ONLY £29.99

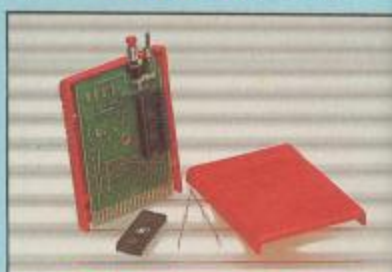

MOUSE

- ☐ CBM 64/128 mouse.
- ☐ Wide compatibility with software including: Blazing Paddles.
- ☐ Works by mimicking joystick so will work in any joystick application including graphic packages only designed for joystick.
- ☐ Functions on either joystick port.
- ☐ Optical system operation.

ONLY £24.99

CHIPS

- ☐ 27128 **£3.00 EACH**
- ☐ 27256 **£4.50 EACH**

CARTRIDGE DEVELOPMENT SYSTEM

- ☐ All the necessary parts to produce an 8K/16K auto-start cartridge.
- ☐ Top quality PCB. ☐ Injection moulded case.
- ☐ Reset switch. ☐ 16K EPROM.
- ☐ "Cartridge Handbook" gives full details and tips on building and configuring the cartridge for many uses.

ONLY £12.99
complete with handbook

Byting into the 6510

In the fourth part of our machine code programming series, we design a typewriter routine and learn more about flags and conditional branches.

By Burghard-Henry Lehmann

In the last three articles we have worked our way up to a point where we can now fill in the whole of the Commodore screen. In the following articles I want to develop a simple word processing program. I feel that this will cover a lot of ground in terms of machine code programming. Even if word processing is not your main interest, you will find that a lot of the principles we will deal with are just as relevant to you if you want to write an arcade game, an adventure game, a utility routine or whatever.

Of course, in the context of this series, it is not my intention to write a fully-fledged word processor you can use to hack out a novel. All I want to develop is a simple 40 column typewriter routine and some associated editing routines.

Key Input

So far we have dealt mainly with setting the computer to output data, namely to the screen. Now, where we want to develop a word processing routine, initially we need to get the computer to input data, namely from the keyboard.

Computer keyboards are very versatile - each key on the board represents nothing more than an electronic impulse, and what result this impulse has depends on a program, resident in ROM, which interprets it. So, each key on the board can do just about anything you want it to do. The A key on your C64, for example, can result in a capital letter A being printed onto the screen, as happens normally, or it can print a lower case a, if you switch the computer into the business mode; or you could re-design the A key into something completely different, like function key 1, or make it start

your printer, hum a tune, or whatever you like.

All this is simply a matter of programming. As I have already mentioned, in the normal state of the C64 there is a program in the Kernal-ROM which interprets every impulse coming from the keyboard and converts it into an ASCII-code. This ASCII-code is stored in a series of locations, called the keyboard buffer.

Whenever the computer has nothing else to do, the keyboard buffer is emptied one by one and each ASCII-code is executed, that is, if it is a so-called printable character, the character is printed onto the screen, or, if it is a non-printable character, a certain action is taken, like moving the cursor, changing a colour, starting a new line, and so on.

All this is done by our good friend, the 6510 microprocessor. But since there is only one 6510 chip in each Commodore 64 computer, the question arises of 'how can all this be done without the system getting into an awful muddle about what to do first?' Furthermore, when you press a certain key you expect to get the result almost immediately! How can this be done if there is only one microprocessor which has to do this and a whole lot of other tasks besides?

Interrupts

The answer to this important question is 'interrupts.' This is a fascinating subject because it permits an 8-bit computer like the C64 which can basically only do one thing at a time, to pretend to do several things at the same time. It works because the 6510 microprocessor is able to do things at such tremendous speed. It's a bit like a magician who does tricks by sleight of hand - you can't see how he does it,

mainly because he does it incredibly quickly.

The 6510 has all the speed of the best magicians, but, of course, it has none of the brains of a Houdini. Instead it does its tricks strictly to order.

Every 60th of a second it gets an interrupt command which it has to follow, except it just has executed a machine code command which instructs it not to react to this interrupt. This is called a 'maskable interrupt,' because the microprocessor can be stopped from reacting to the interrupt. There is also a 'non-maskable interrupt' which cannot be aborted at all. We will return to all this later.

If the 6510 is not programmed otherwise it executes the maskable interrupt by interrupting whatever it is doing at this moment and saving the current address in the program counter on the machine stack so that it can continue from where it left off afterwards. Basically, it is very much like being called to execute a subroutine. The only difference with an interrupt is that the subroutine call does not come from inside the program with a 'JSR' instruction but is hardware-generated.

Hardware-generated means that a certain action the microprocessor has to perform is not instigated by a program but an electronic impulse coming from outside the microprocessor, as from a printer or disk drive or, as a matter of fact, another chip in the computer.

The interrupt routine which the 6510 executes every 60th of a second consists firstly of reading the keyboard. That is, the 6510 finds out if a key has been pressed. If a key has been pressed it goes through quite a complicated routine which interprets

Figure 1

BNE = Branch if result is Not Equal - if the zero-flag is NOT set
 BEQ = Branch if result is Equal - if the zero-flag is clear
 BCC = Branch if the Carry flag is Clear (A is smaller than B)
 BCS = Branch if the Carry flag is set (A is larger or equal B)
 INC = INCrement contents of memory location
 DEC = DECrement contents of memory location
 CMP = CoMPare with memory
 CLC = CLear the Carry flag
 ADC = ROd with Carry
 SEC = SEt the Carry flag
 SBC = SuBtract with Carry

that keypress.

I said before that each key generates an electronic impulse. This sounds very complicated, but isn't. All it means is that if any key has been pressed, a voltage is coming from the keyboard, while if no key has been pressed, there is no voltage. This means of course that the impulse generated is exactly the same for each key. How can it then distinguish between keys?

The keyboard is mapped into a coordination system and each key is interpreted by determining from which part of this co-ordination system the impulse comes. It's a long process of elimination, and the end result of this is an ASCII-code. This ASCII-code is then pushed into the keyboard buffer (location 631-640).

Amazingly enough, this is not all the 6510 does every 60th of a second, if the machine is in the normal mode it also puts the cursor on the screen into another 'blink-phase' so that it will appear to us slow humans as if the cursor is flashing.

Having done all this, the 6510 returns from the interrupt, recovers the address where it left off and continues with the task it was doing before as if nothing has happened. Quite amazing isn't it?

Returning now to our word processing task, there would be little sense in our writing a routine which reads the keyboard per se. All we need to do is to get hold of the last ASCII-code produced by the microprocessor and then write a routine which tells the 6510 what specifically we want it to do with that ASCII-code.

For that it would be best if we could have that ASCII-code in the A-register of the 6510. For this I use a very simple ROM-routine, called 'GETIN', which gets one character from the keyboard buffer and puts it into the accumulator. If there is no

character in the keyboard buffer, that is, no key has been pressed, then a zero is loaded into the accumulator. This of course sets the zero-flag.

In line 340 of our program I introduce the opposite of the 'BNE' branch instruction which we have already learnt about. 'BEQ' stands for 'Branch if the result is Equal', that is, if the zero flag is set.

What we want to do here is obvious: if no key has been pressed, which results in the zero-flag being set, we loop back to the 'GETIN'-routine, until a key has been pressed.

Now the zero-flag will be clear because a number larger than zero will be in the accumulator. This is of course the ASCII-code we wanted. It tells us which key has been pressed. It is now up to us to do whatever we want with it.

Exit

'Exit already?' you may ask. 'We haven't even started yet.'

But this is very important in machine code programming. Remember, the 6510 has no safety-nets and doesn't give any error reports. If you set it on a certain course and don't tell it when to stop it will go on ad infinitum. There might be no way you can stop it, except by unplugging the machine. So always ask yourself the question: 'Has this routine I am writing got an exit?' This is more important in machine code programming than in almost any other language.

Most other bugs you can iron out in due time without much frustration. But if the 6510 gets itself into a routine or loop without an exit, you are well and truly lumbered. All you can do is unplug the machine and lose perhaps hours of your work!

Surprisingly enough this but can

even occur when your routine is basically working fine. For example, our typewriter routine would work perfectly without an exit. The problem would only arise when we want to get out of it. Because we can't except by unplugging the machine...

The exit I have chosen for our program is function key 1. If it has been pressed the ASCII-code 133 will be in the accumulator. So in line 380 I compare whatever is in the accumulator with 133 so that, if it matches, the zero-flag will be set and the 6510 will jump to the exit-routine in line 1110 via the branch instruction 'BEQ EXIT'.

In line 440 I do another test, this time against decimal 20. If you look onto page 135 of your user manual where all the ASCII-codes and how the C64 interprets them are listed, you'll find that decimal 20 is normally the value for the delete key.

Since I wanted to include a deletion routine in our program, line 450 is where the microprocessor will branch to if the appropriate key has been pressed.

Printing a Character

The routine in lines 470 to 740 outputs a printable character to the screen.

There are two sides to this routine - first we have to convert the ASCII-code into a screen code which the 6510 can put on to the screen in the usual way and secondly we have to determine the position on the screen where we want the character to be printed.

If you compare the ASCII-codes on page 135-137 in your user manual with the screen codes on page 132-134 you'll find the following main differences in the way the various characters are expressed.

Codes 32 to 63 match exactly. ASCII-32 is always a space and that is the first of the printable characters in the ASCII-range. After that follow various symbols, like "%" and "\$" then the numbers from 0 to 9, then some more symbols and punctuation marks. All these are the same in ASCII-codes and screen codes, which means that we can write them to the screen unchanged.

From ASCII-64 onwards the two lists diverge: The "A" in a circle is ASCII-64, but screen code 0. In short, for everything that follows from 64 we have to subtract 64 in order to arrive at

the proper screen-code.

This kind of thing is unique to the Commodore range of computers. The reasoning behind it is to be able to have two separate character sets. Set 1 is meant for graphic purposes, while Set 2 is meant for word processing.

Since it is word processing we want to do, we are interested in Set 2 which gives us capital and lower case letters.

Lines 280-290 switch the C64 into the business mode or lower case mode, as it is also called. ASCII-code 14, which is one of those non-printable characters I have mentioned above, is loaded into the accumulator and the ROM-routine at \$E716 'executes' the code, meaning in this case, switch the C64 into business mode. You get the same result if you enter the BASIC-command "PRINT CHR\$(14)" or press the Commodore and shift key together.

"\$E716" is a hex-number. So far I have on purpose avoided dealing with hex, because, unlike other machine code programmers, I do not consider hex an absolute necessity to successful machine code programming. Nevertheless, at a later date I will introduce you to the mysteries of hex too. At this moment just enter the number as it is given in the listing.)

If a key and the shift key are pressed at the same time the "GETIN" routine will return an ASCII code which consists of the normal ASCII code+128. Therefore any ASCII code larger than 128 has to be a capital letter. Anything smaller is lower case.

The Carry Flag

So we want to know first of all if a number in the accumulator is smaller or larger than 128.

This brings us to the second most widely used flag in the PS or flag register; the carry flag.

In simple terms, the carry flag is set if the result of a subtraction does not go, that is, if the result is negative and it is clear if the subtraction goes, that is, the result is positive. Since subtracting two numbers from each other is the arithmetical way of comparing them with each other, the carry flag serves the extremely important purpose of telling us when one number is larger or smaller than another.

If A is smaller than B, carry will be clear. If A is larger than B, carry will be

set. Furthermore, if A equals B, carry will be set too.

Where there is a flag there have to be conditional branch instructions testing that flag. By now it will have become clear to you that this is the way we program the 6510 to make decisions. We arrange a certain operation which has an affect upon the flag we are interested in, then we test that flag with the appropriate branch instruction and this makes the 6510 jump to the appropriate routine.

The carry flag is tested and acted upon by two branch-instructions which are "BCC" and "BCS". "BCC" ("Branch if the Carry flag is Clear") asks if the carry flag is clear. If yes, the 6510 branches, if no it doesn't. And "BCS" ("Branch if the Carry flag is Set") asks if the carry flag is set.

Or, to put it differently, "BCC" branches if the number we are testing is smaller than the one we are testing it against. And "BCS" branches if that first number is bigger than or as big as the second one.

In our routine we want to know if the carry flag is clear after it has compared the ASCII code in the accumulator with the value 128 after the "CMP" instruction.

If carry is clear, it will mean that we have a lower case letter, and, as you will discover shortly, in this case it suits us to jump forward.

If carry is set, we've got a capital letter on our hands and want to subtract 64 from it. Then we go into a second test, and if the remainder is larger than 64, then we again subtract 64. The result will be a number larger than 64, and if you look that up in the manual, you will find that in Set 2 that indeed gives us a capital letter.

In a minute it will become clear to you why I subtract 64 twice and not 128 once. First let us look at the subtraction operation itself.

Subtraction

As long as you operate within the 8-bit range of numbers, subtraction (and addition) is quite straightforward on the 6510: You simply put the number you want to subtract from into the accumulator and then give the number you want to subtract together with the "SBC" instruction, which stands for "Subtract with Carry". The result of your subtraction will then be put into the accumulator. But why subtract "with carry"?

With each subtraction the state of the carry flag is taken into account. Because of this it is prudent programming to use an additional instruction every time we subtract.

"SEC" stands for "SEt the Carry flag", and this is one of the few instructions of the 6510 which are used to program the flag register directly. If we didn't do this and the carry flag was clear, the subtraction would be incorrect by one.

So always remember - before you subtract, ensure that the carry flag is set by using the "SEC" instruction!

Addition

Addition is done in the same way, but now you have to ensure that the carry flag is clear. To do this, use "CLC", which stands for "Clear the Carry flag".

Unlike other micro processors the 6510 has no addition or subtraction instructions which do not take the carry flag into account. So, play safe and always set the carry flag properly before you add or subtract!

Both the add and the subtract instructions can be given in all the addressing modes. That is, you can give the number you want to add or subtract immediately or you can tell the 6510 the location, where the number is, in all the various addressing modes which we have described in the last three articles.

In our routine we do it immediately of course because we are dealing with fixed values.

At this point I have to admit that the use of "SEC" in lines 510 and 550 is not necessary in our routine.

Can you guess how this exception to the rule I gave you above comes about?

Well, each time, before we subtract, we test if carry is clear. And if carry is clear it jumps over the subtraction routine. Therefore, when it does the subtraction carry has to be set! So when typing the program in you can omit lines 510 and 550. But remember, in most other situations you can't be that sure and have to use either "SEC" or "CLC"!

In line 530 I compare the remaining ASCII-code again with 64. This is to test if it's a character in the range 32 to 63 or a letter in the range 64 and upwards.

If it is a letter then I have to

subtract 64 again, and now it will become clear to you why I subtract 64 twice in the case of a capital letter: In this way I have a nice flow to this routine, otherwise I would have to make it jump over the second subtraction which costs extra bytes for a jump-instruction.

Having at last arrived at the proper screen code we can now print the character onto the screen.

Print Position

We print the character onto the screen in exactly the same way as we have described in the last article by using indirect-Y.

There is only one major difference: Because of the nature of the program we are writing it doesn't suit us simply to increment the index to arrive at the next position. Instead we prefer to have the exact current position always in "SCREENMEM" and "SCREENCOL". This is useful for when we want to design all sorts of additional input routines, like cursor-left, cursor-right, cursor-up, cursor-down and so on. Using indexed-Y would make it too complicated.

But because of this we have to ensure that Y contains 0 whenever we output a character. This is done in line 600, and you might think that this is not really necessary since we haven't used the Y register anywhere else.

But remember the "GETIN" routine at the beginning! Most ROM routines use all of the registers and thus corrupt them. So we can't take it for granted that Y will still contain 0 after it has returned from the "GETIN" routine.

This is another important point: Always be aware that ROM routines (as well as subroutines written by yourself) use and corrupt registers. So if you need a certain variable, you might have to save it before calling on the ROM routine and restore it afterwards! Of course, in our case we don't have to save Y since we know that it always has to be zero when we print it.

Counting Upwards

The overall gist of our print routine is that we want to print a character to a certain position and then update our pointer-locations ("SCREENMEM" and "SCREENCOL") so they point at

the next print-position. Since we write in our culture from left to right the next print position is one more than the former one. In other words, we count upwards.

Again because of the limitations of the 6510 this is not as straightforward as it should be. Sure, as long as we are within the 8-bit range there is no problem. We just increment the location or register by one. But the moment we arrive at 256 it will of course overflow, which means that the location or register notches back to zero.

This is where the high-byte of the number we are dealing with comes in. Every time we reach 256 (or 0), the high-byte has to be incremented by one.

This is not done automatically by the micro processor. It has to be programmed!

So, in line 670 we increment the low-byte of "SCREENMEM". Then we test the zero-flag. As long as the result of the former operation is between 1 and 255, the zero-flag will be clear. Therefore BNE branches us over the following instruction which increments the high-byte of "SCREENMEM".

Only when we reach the crucial 256 (or 0) point will the zero-flag be set. Now it won't branch and the high-byte of "SCREENMEM" will be incremented (line 690).

Lines 710 to 730 do the same thing with "SCREENCOL", and then our routine is finished. We jump back to the "GETIN" routine (lines 720 or 740 respectively, depending upon the high-byte having to be incremented or not) in order to await the next keypress and repeat the whole process.

Deletion

The deletion routine which follows is in a way more straightforward than the print routine. All we want to do is to decrement our print position by one and print a space over the character which we want to delete. (In a later article I will give you a more sophisticated deletion routine which is similar to the one used when you press the delete key normally. But for the time being this one will suffice.)

To start the routine it is prudent to build in a safety catch. After all, we don't want it to be able to go backwards ad infinitum and write

spaces into all sorts of locations. So we want to prevent the deletion routine from going over the beginning of the screen.

In lines 820 to 870 I tested the current screen-position against the beginning of the screen, which is 1024. If the two halves are equal, the routine jumps straight back to "GETIN", that is, no deletion-action is taken.

Because I compare two 16-bit numbers with each other I have to do the comparison in two goes. First I compare the two low-bytes. If they don't compare I will know already that it isn't at the beginning of the screen. In line 840 the zero-flag will be clear and it will jump straight to the beginning of the deletion routine.

If, on the other hand, the two low-bytes are equal this is still not conclusive evidence that I am at the beginning of the screen. So I now have to test the two high-bytes. If they too are equal, then I know for sure that it is at the beginning of the screen.

Counting Downwards

Now we want to decrement the screen position by one so that we can print the space and thus erase the former letter.

Counting downwards on the 6510 is even more involved than upwards, if we are dealing with a 16-bit number.

First I load the low-byte into the accumulator in order to test the zero-flag. If the zero-flag is clear, that is, if the low-byte is between 1 and 255, then I need only to decrement the low-byte.

But if the zero-flag is clear, that is, the low-byte contains 0, then I have to decrement the high-byte as well as the low-byte.

Finally

The rest of the deletion routine and the main exit of our program in line 1110 should be clear.

Listing 1 gives you the whole of the program I have described in this article and in figure 1 I give you a list of the instructions we have dealt with in this article and in the last one.

When you try the whole program out you will find that rather irritatingly something is missing: There is no cursor!

Next time I will explain how we can add a cursor to our routine, and an interrupt driven cursor at that. So until then, watch this space - it'll be good.

California Games

If you want sunshine and fun, then look no further than the latest release from Epyx.

By Eric Doyle

In the wake of Summer, Winter and World Games come the Epyx thrills and spills of the sunshine state.

Just when I thought that the Epyx Games series had run its course, US Gold pull a stunt like this on me! For my money California games is the best yet, and that's really saying something. The graphics are radical, the gameplay is varied and the sound...well it's better than the previous games!

Up to eight players can share the experience of the six competitions and each competitor can have a sponsor. Yes folks, Sponsorship has arrived and, when the finished version appears, US Gold hope to have a set of British sponsors.

First of all, dust off your skateboard for the Half Pipe event. As the name suggests this event takes place on the inner surface of an enormous tube cut in half. There are three basic turns you can make to score points: the basic Kick Turn, overhead Hand Plants and super flashy Aerial Turns. The trick is in your timing and speed - go too fast or hold a turn too long and you'll wipe out.

You have just a minute and a quarter to stun the judges with your talent, but fall three times and you'll hang up your skateboard early.

After all this action at earth tremor prone Beveley Hills, we now head for the beach because it's 'Foot Bag' time. Foot Bag? Yes it's the latest craze for macho types. Keep a little baggy ball in the air without the aid of your hands and perform as many tricks as you can for another minute and a quarter.

Surely there can't be that many kicks you can perform? Well there are eleven ways to score and each combination of moves revels in a name such as Dizzy Dean, Jester or Axle Foley. Each combination scores a different mark, the most difficult being the Doda. To complete this move you have to bounce the ball with an outside kick onto your head and then kick the ball back with an outside kick from your other foot!

Even California has seagulls and there is one that keeps flying across the screen. If you can hit it with your ball you can score extra points as the bird spins parson's nose over beak with threats of revenge.

After beating your feet on the beach you go on to ride the rollers of the Pacific. 'Surfing' is a passion for Californians and catching a wave is almost a religion. The massive rollers curl as they break forming a tube and it's the aim of every surfer to ride inside the tube. High scores can be achieved for this trick and you can also perform leaps, catch air by just letting your 'woody' overlap the crest of the wave or perform daring 360° turns.

At the end of each turn a group of beach bums offer their opinion of your run and a score is averaged out from this.

'Roller Skating' on the promenades of Californian beaches is hazardous because of all the junk scattered around. In this simulation you have to leap over all of the obstacles thrown in your path. If you have the aforethought and grace to execute a tasteful spin as you jump, your point score is boosted. Beach balls, cracks, uneven surfaces and junk food containers have all to be negotiated before you complete the course.

Did you know that 'BMX' stands for Bicycle Motocross? In this game it also stands for Blue Murder and exasperation! It seems the litter louts have been at it again and the course is strewn with logs, tyres and oil drums. The path undulates into series of whoop-ti-dos and you can wheelie your way along the straights and perform superb leaps from the tops of the highest ramps.

As you jump you can gyrate in one of several ways for lots of lovely bonus points. The most difficult stunt to perform is the forward somersault which can bring a maximum of 6000 points. Compare this with my high score and draw your own conclusions.

By this time a more sedate pastime would be welcome and what have we got? Frisbie or to be more up-to-date: the 'Flying Disk'. All you have to do is to throw it as far as you can and catch it before it touches down. Not as easy as it sounds. First the thrower has to gauge the strength and angle of the shot. Then the catcher has to get into position and catch the disk as it passes.

These are the games and I've spent hours trying to beat my own high scores. To give you something to aim for here are my scores so far:

Half Pipe	3075	Roller Skating	2630
Foot Bag	77500	BMX	5432
Surfing	5.2	Flying Disk	1300

If I had to lose all but one of my Epyx Games disks, I would choose to keep this one.

THE NL-10 PRINTERS FOR BUSINESS

This is the class printer in its price category. The perfect choice for Commodore owners because the interface is changeable. So buy with the 64/128 cartridge then if you change computer at a later date just buy a new cartridge!

In a group test with other popular printers in the price category such as Epson, Citizen & OKI What Micro described the NL-10 as "THE ROLLS ROYCE OF THIS GROUP". Why settle for less? (Amiga users order with parallel cartridge, price includes cable).

- Auto single sheet feed
- Tractor & Friction feed
- "Front Panel" mode selection
- Interchangeable i/face cartridges
- Double & Quad height characters
- Low cost cut sheet feed
- Superb "NLQ"

NL-10
New LOW price
includes 2 spare
ribbons FREE!
(value £13.90)

Selected Products

- DISK NOTCHER.** Double your disk capacity, allows you to easily & accurately cut a second write protect notch..... **£4.95**
 - POWER PACK.** Replacement power pack to suit '64'..... **£24.95**
 - AZIMATE 3000.** Check and adjust CBM cassette head alignment. Easy to use..... **£6.95**
 - MOTHERBOARD.** 4 slot with either all upright or with one straight thro' for modem use, please state type when ordering..... **£28.00**
 - XETEC SUPERGRAPHIX.** The best centronics i/face for 64/128, 8K buffer downloadable fonts etc. very good..... **£69.95**
 - DATA RECORDER.** CBM compatible type. Same performance etc. as C2N/1531 but cheaper and with pause..... **£24.95**
 - 1541C DISK DRIVE.** We will sell you one but why not buy an Excelsior, less money and many advantages..... **£189.95**
- We have a good stock of Commodore related equipment. If you don't see what you want please give us a call

SPECIAL OFFER: PRICE NOW INCLUDES DOLPHIN COPY

DOLPHIN DOS

THE EFFECT IS STAGGERING.

The established standard parallel operating system for the 64/128 and 1541 disk drive. Now in use with most of the top software houses including Gremlin, Software Projects, Thalamus, CRL Alligata, Superior etc. etc. as well as many of the top independent software programmers. The speed and efficiency is incredible, who would believe that the humble old 1541 could load 202 blocks in less than 5 secs. It is compatible with the majority of commercial software and can be switched out when necessary. One of the real pleasures of using this system is to use it with the likes of EasyScript & Superbase to speed up both the normal loading and the sequential files. It is important to point out that this is achieved using standard CBM disk format and not a special system, therefore you can still use your existing disks.

INSTALLATION

Fitting involves fitting two sub assembly boards, one in the 64/128 and one in the 1541. Normally these just plug in but some '64s need a small amount of soldering.

EXTRAS AVAILABLE

- User port expansion card..... **£14.95**
- Kernal for '128 in '128 mode..... **£9.95**
- Second drive assembly..... **£44.95**
- Dolphin Copy (selection of copiers includes very powerful nibbler, extra fast unprotected and selective file)..... **£7.95**

ONLY
£69.95

SOME OF THE FEATURES

- LOAD speed 25x normal (PRG)
- SAVE speed 12x normal (PRG)
- LOAD speed 12x normal (SEQ)
- SAVE speed 8x normal (SEQ)
- LOAD/SAVE 3x normal (REL)
- Easy & fast DOS commands
- Format 40 tracks (749 blocks)
- Monitor built in
- LOADs 202 blocks in 5 secs
- Enhanced screen editor
- Drives centronics printer
- Extra BASIC commands
- Compatible with standard DOS
- Can be switched out

Disks Boxes

- 25 bulk packed DS/DD disks. With sleeves, w/p tabs and labels. Good quality & fully guaranteed..... **£13.95**
- 25 disks + box. Disks as above plus 50 capacity locking storage box..... **£22.95**
- 25 disks + box. As previous offer but with 100 capacity locking box. A very popular offer..... **£24.95**
- 50 capacity box. High quality lockable disk storage. Smoked perspex top..... **£10.95**
- 100 capacity box. Larger capacity version of above..... **£13.95**

FOR SPEED, POWER AND EASE OF USE FREEZE MACHINE

Now with..
"Single part
save"
Includes..
"Freeze
Frame MkV
& Lazer II"

- **Freeze...**
Totally unstoppable Freeze facility from the originators.
- **Fast Save...**
Saves in as little as 15 seconds. Nothing else can match this.
- **Multiple Save...**
Make as many saves as you want once frozen, in different styles if you wish.
- **Ultra Compact...**
The most efficient compact? Our tests indicate this, as many as 5-6 games per disk.
- **Game Killer...**
Incorporates an effective routine to disable collision detection.
- **Independant...**
Even produces stand alone Lazer files that reload in as little as 10 seconds.
- **Ease of use...**
Always a strong feature, now even more enhanced.
- **Multi-Load...**
Standard cartridge handles many games of this type. With the utility disk even more!
- **Fast Format...**
Formats your disks in about 12 seconds.
- **File Copier...**
Built in fast copier handles files up to 248 blocks long and is really easy to use.
- **Two Fastloads...**
A normal disk turbo at 5-7 times normal PLUS the astonishing Lazer at 20+ times normal...BUILT IN.
- **Selectaload...**
Just use cursors to scroll to the program you want and press a function key.
- **Reset...**
Built in, so you can enter pokes for more lives etc.
- **Tape Turbo...**
For quick save/reload on tape.

CHILLS THE REST!

"...far outstrips the opposition on both price and performance ..."

Commodore Review

"...the most exciting and lightning fast I have ever used..."

Commodore Computing International

Why Freeze Machine?

This is the latest and most effective backup cartridge from Evesham Micros, the originators. It's speed of operation is the staggering feature. Imagine being able to SAVE & reLOAD your favourite games in as little as 10 seconds and no more than 18. No other "device" can remotely match these figures...remember these facilities are built in. Buy the "Freeze Machine" and see it perform, if you don't agree that it is the most formidable cartridge available return it within your statutory 28 days for full refund, we are that confident.

ONLY
£28.95

UPGRADES

MKIV.....£ 7.95
Lazer.....£ 2.00

**FREEZE
MACHINE
Strikes Back**

Freeze Machine Utility Disk V3.0

Latest version of the disk that complements the use of the Freeze Machine. Includes well over 30 routines. Allows the complete transfer to disk of many programs that load extra parts as the game progresses (the ones the standard cartridge cannot handle). Includes many of the latest popular titles like Last Ninja & Gunship plus many "standards" like World Games & Supercycle. A very useful add-on to your Freeze Machine.

Upgrades: £2.00

ONLY **£7.95**

QUICKDISC + Disc Disector V5.0 DOUBLER

Our highly popular fast load/save plus utility cartridge has received many favourable reviews.

- FAST LOAD (5-7 times faster)
- FAST SAVE (5-7 times faster)
- FAST FILE COPY (up to 248 blocks)
- RESET BUTTON (unstoppable)
- DRIVES CENTRONICS PRINTER
- FAST FORMAT
- FAST DISK BACKUP
- EASY DOS COMMANDS
- HELP MENU
- 128 COMPATIBLE ('64 mode)

only
£19.95

1541 Quiet Stops

Cures the dreaded 1541 drive "hammering"!!

- EASY TO FIT
- DETAILED INSTRUCTIONS
- ONE KIT DOES TWO DRIVES
- HELPS PREVENT ALIGNMENT PROBLEMS

Not suitable for "turn lever" type drives

only
£4.95

Our well established and extremely popular disk backup/utility package. The powerful nibblers can produce backups of most protected software. Also includes many parameters for difficult to copy software. This latest version will handle many titles by Hewson, Ocean, Domark & U.S. Gold that rival products can not. Beware of American & German copy programs that will not handle the popular British titles.

INCLUDES THE FOLLOWING

- EVESHAM 3 MINUTE NIBBLER
- EVESHAM 8 MINUTE NIBBLER
- MANY PARAMETERS (the vital code for the protection schemes)
- DUAL DRIVE NIBBLER
- MENU MAKER
- DISK ORDERLY
- DISK RESCUE
- UNSCRATCH
- DISCOMON+
- ETC., ETC.

The whole package is easy to use and menu driven. Works with '128 in '64 mode and most routines 1570/1 compatible. Perfect operation with Excelsior+.

only
£19.95

THE Tape Backup "device"

Many thousands of this popular product have been sold and still sales flourish. Why? We think because it is the best product of its type. It consists of hardware and software and uses a unique method, controlled by the software, that will allow you to make a perfect backup of your tape software.

- EASY TO USE
- VERY SUCCESSFUL
- USES TWO CBM TYPE DATA RECORDERS

only
£12.95

1541 Physical Exam

Does your 1541 suffer from...

ALIGNMENT PROBLEMS

If so you need this package. Contains digital alignment disk and drive fault diagnosis software that allows you to both check and correct head alignment & speed.

- CHECKS ALIGNMENT
- CHECKS SPEED
- CHECKS BELT & CLAMPING
- DETAILED INSTRUCTIONS
- INCLUDES QUIET STOPS

Bothersome Basic

Continuing our Basic series, the highly strung personality of the Commodore is revealed

By Eric Doyle

One thing that never ceases to amaze me about computers is the way they appear to have intelligence. The more you get involved with programming the more you realise what an illusory phenomenon this is. The simplest way of building 'intelligence' into your programmes is by making the computer appear to respond on a personal level:

```
10 INPUT“(CLR,DOWN,DOWN)
HELLO, WHAT'S YOUR FULL
NAME”:NAME$
20 IF NAME$="" THEN 10
30 ? "OH, IT'S YOU ";NAME$;".
I'VE HEARD A LOT ABOUT
YOU!"
```

When you type in this program, remember that the characters in the square brackets are not entered as you see them here. After opening the quotation marks, ignore the square brackets completely and hold down the SHIFT key and press CLR/HOME. This will give a reversed out heart shape.

Next, you press the cursor down key to give a reversed out letter Q and then press again for a second Q. When the program runs, this will cause the computer to clear the screen and move down two lines before printing out the question. For more information on

these symbols, refer to the *Listings* page in this month's issue.

I have used the word INPUT instead of PRINT at the beginning of the line and so when the program is RUN the computer will know that something will be entered later via the keyboard. After the question, the semi-colon prevents the computer from jumping down to the next line. In response to the INPUT command and the semi-colon the computer will finish off your question with a question mark and the cursor will reappear and flash at the end of the line.

The program is still running at this point but the computer is waiting for a response from the user. We want the computer to 'remember' what is typed in, so we have to tell it to store the answer somewhere. We have seen that the computer stores information as a variable but so far these have only been numbers. This time the variable will be a series of letters.

Variable Questions

For storing such an input, the computer has a special kind of variable known as a string which is indicated by a variable name (NAME) and this is labelled as a letter store by adding a dollar sign (\$) after it.

Number variables, or the correct term, numeric variables, can be directly assigned in a program (A=125) and strings can also be directly assigned: NAME\$="ERIC". Notice that the string of characters is placed inside quotation marks. When a string is INPUT from the keyboard the computer assumes that the response has quotation marks around it, so you don't have to bother to put them in.

After RETURN is pressed the computer checks to see whether something was entered by executing line 20. The IF/THEN command is fairly self-explanatory. If the contents of NAME\$ has nothing between the quotes THEN the program will loop back to rerun line 10.

If something has been typed in, the program then executes the final line. This is simply a PRINT statement modified to insert the name in the middle. Once again semi-colons are used to force the computer to keep printing on the same line. To see the effect, erase everything after the first semi-colon and enter two new lines:

```
40 PRINT NAME $;
50 PRINT ". I'VE HEARD A LOT
ABOUT YOU!"
```

After running this to see that the result is the same as before, try erasing the semi-colons to see what effect they had.

Once you have created a string there are special commands which enable you to manipulate it in various ways:

```
10 A$="YOUR COMMODORE"
20 B$=LEFT$(A$,3)
30 C$=RIGHT$(A$,1)
40 D$=MID$(A$,4,8)
50 E$=B$+D$+C$
60 ?A$;?B$;?C$;?D$
70 ??:?E$
```

After line 10 sets up A\$, line 20 saves the three leftmost characters as a new string, B\$. Similarly, C\$ becomes the single letter to the extreme right of A\$.

Line 40 takes a little more understanding. It tells the computer to save an internal string from A\$ which starts at the fourth letter and takes eight characters in all. D\$ therefore consists of the row of letters from the R of 'Your' up to and including the D.

Line 50 shows how strings can be added. This is not like adding numbers together, because one string is abutted onto the end of another. It's rather like saying that $2+5+6 = 256$! Strings can only be added, using any other mathematical operator other than plus will produce a TYPE MISMATCH ERROR message.

We can use string manipulation in our original program. Add this:

```
21 A=1:B=0
22 FOR C=1 TO LEN(NAME$)
23 IF MID$(NAME$,C,1)=CHR$(32)
  THEN PART$(A)=MID$(NAME$,B+1,C-1-B):B=C:A=A+1
24 NEXT C
25 PART$(A)=RIGHT$(NAME$,LEN(NAME$)-B)
30 ?"OH, IT'S YOU "PART$(1);".
  I'VE HEARD A LOT ABOUT YOU!"
```

Forget line 21 for the moment and concentrate on 22. We're trying to split a full name into forename, middle name(s) and surname. When we write our names we denote the end of one word and the beginning of another by leaving a space between them. If we search along NAME\$ for a space we

know that all the characters before the space form a part of the full name.

How Long is it?

Several people may use this program, so we don't know how long each name will be. Fortunately BASIC includes a way of calculating this. The keyword LEN will return the length of any string mentioned in brackets after it. We use this in line 22 to determine the parameters in a FOR/NEXT loop which will repeat as many times as there are characters in NAME\$.

In line 23 we use MID\$ to test each character in turn to see if it's a space. Instead of specifying which character the MID\$ starts with, we let the loop do this by using the current value of C, and because only one character is examined at a time we get the expression MID\$(NAME\$,C,1). If this doesn't equal a space which has a character value of 32, ie CHR\$(32), the program ignores line 23 and jumps to line 24. If it is a space THEN several things happen.

First of all a new string is formed. You'll notice that PART\$ is followed by (A). As the value of A changes we get a series of new strings: PART\$(1), PART\$(2) etc. This is known as an array. Each string, called an element, in the array has the same string name but the value in brackets denotes that each string is in fact different from all the others. The number in brackets can only range from zero to nine unless we tell the computer otherwise.

When the first space is met A has the value of 1 as specified in line 21 so PART\$(1) takes the result of the MID\$ expression calculated on the other side of the equals sign. Let's study how this formula is derived.

A space has been found at character number C of the name. This part of the name stretches from the beginning of NAME\$ to the character before the space which means the last letter's position is the space's position minus one, that is C-1. For the forename this would mean PART\$(1)=MID\$(NAME\$,1,C-1) so where does the B come in?

Let's see what happens with the second name. Again the last character will be the one before the next position (C-1) but the name starts somewhere in the middle of NAME\$. The actual position is the last space position plus one. If we calculate this when we separate off the first name with the

expression B=C we can use B+1 as the start of the second name. This makes MID\$(NAME\$,B+1,C-1) but C-1 gives the total number of characters from the beginning of NAME\$ to the character before the second space. That's too many, as we only want the number of characters from the last value of C to the current value of C.

Luckily, we have stored the last value of C when we said B=C so if we subtract B from the current value of C we get the length of the second name. This includes the space at the end of the second name, so we still have to subtract one, hence we get MID\$(NAME\$,B+1,C-1-B).

What value do we give B to start with? Remember I said earlier that the first name could be given by the expression MID\$(NAME\$,1,C-1). If we substitute a zero for B in MID\$(NAME\$,B+1,C-1-B) we get MID\$(NAME\$,0+1,C-1-0) which simplifies to MID\$(NAME\$,1,C-1). Eureka! We have the magic formula which covers all cases if B is given an initial value of zero (as specified in line 21).

What happens when we reach the end of the name? Since there is no space at the end the 'IF MID\$ is a space' condition is not fulfilled so no string is set up for the surname. To overcome this we have line 25:

```
25 PART$(A)=RIGHT$(NAME$,LEN(NAME$)-B)
```

All we have done here is to chop off the end of NAME\$ from the last value of C which was stored as variable B. This is subtracted from the full length of NAME\$ to give the length of the surname: LEN(NAME\$)-B. as the surname goes to the end of the string we can isolate it by taking the RIGHT\$ to the length of the surname: RIGHT\$(NAME\$,LEN(NAME\$)-B).

Finally, I've modified the last line to address the user by first forename only: PART\$(1).

We can now use what we've found to make the computer appear even more human:

```
40 IF A > 1 THEN ?"YOU HAVE";A;"PARTS TO YOUR NAME, ";PART$(1);".
50 ?"GIVE MY REGARDS TO THE REST OF THE ";PART$(A);
60?"FAMILY WHEN YOU NEXT SEE THEM."
```

This is not a perfect program, so play around with it this month and we'll see how to error trap in a subsequent issue of *Your Commodore*.

A Valuable Utility

Before we jump into the Deep End I have two more things to say. First of all, if you type LIST, long programmes zoom up the screen at a ridiculous speed. Pressing CTRL as it lists does help a little, but the lazy way to get a slow listing is to use this little tip. Type in POKE 56325,1. This does have the side-effect of making the cursor a bit hyperactive but you should be able to type in LIST.

The list will procede at a very low rate of knots and when you want to examine a line you can hold down CTRL and the listing will pause for a long time. To reset 56325 press RUN/STOP and RESTORE. Why spend a fortune on a utility cartridge when it's so easy to slow list?

Finally, I'd like to remind you that any problems which arise out of this

series or any general queries about Commodore Basic should be addressed to Bothersome Basic, Your Commodore, 1 Golden Square, London W1R 3AB. If you want a personal reply please enclose a stamped, self-addressed envelope.

In at the Deep End

When you have a lot of screen displays in a program, typing in all those cursor down and cursor right symbols gets boring and confusing. The PRINT AT command is the only thing I envy about Sinclair Basic. You can get a similar effect on the C64. First set up two strings:

```
10 FOR A=1 TO 39: L$=L$+"
(RIGHT)":NEXT
20 D$="(HOME)":FOR A=1 TO 24: D
$+="(DOWN)":NEXT
```

If you want to see what these strings look like, run the program and

type either POKE 212,1: ?L\$ or POKE 212,1: ?D\$

Now we can set up a subroutine to pick out the bits of these strings that we need:

```
1000 ?LEFT$(D$,Y):LEFT$(L$,X-1);
1010 RETURN
```

Now your text can be printed at a specific position by stiuplating how many columns across (X) and how many rows down (Y) we want the first letter to appear:

```
30 X=10:Y=10:GOSUB 1000
40 ?"TEXT
50 X=25:Y=21:GOSUB 1000
60 ?"POSITIONER"
70 END
```

The routine does not appear to be any slower than the usual symbol method, and is alot easier to set up and uses fewer bytes of memory in most programmes.

More Deep End hints and insights in the near future. Get those letters rolling in! YC

AMAZING NEW 'TOTAL BACKUP' CARTRIDGE FOR COMMODORE 64 AND 128 (IN 64 MODE)

NEW ACTION REPLAY V.3 FROM DOSOFT UNSTOPPABLE 'TOTAL BACKUP' CARTRIDGE

OUR NEW INNOVATIVE HARDWARE AND SOFTWARE COMBINATION GIVES YOU MORE POWER, MORE FEATURES, MORE FUN!!

Action Replay V.3 is now more powerful, has more features and will back up more programs than any competing cartridge! It handles the latest protected games!

Just plug it into the expansion port then press the Magic Button! Our new hardware design makes this absolutely unstoppable. Now you are in complete control. Tape to tape. Tape to disk. Disk to disk.

Nothing else offers all these features at this price!

Mega-Freeze
Freeze and save ANY working program—the Magic Button is unstoppable—unlike other cartridges. Also it is now undetectable by software!

Independent
All programs reload without cartridge—and at turbo speed—tape or disk.

Extra Fast
Make all backups at Turbo Speed—much faster than rival cartridges. Dual speed Tape Turbo is up to 3 times faster than commercial Turbos 10 times faster than Commodore.

Super Compact
Intelligent compacting techniques minimise program size into single files. Save 3 or more per disk side.

Multistage Saves
Transfers MORE multistage loaders from tape to disk than any other. And all parts Turbo load—another feature unique to Action Replay.

So Easy to Use
Action Replay V.3 is a delight to use. All functions described on screen. No user knowledge is required.

to disk. Disk to tape. No special knowledge is required. It tells you exactly what to do. It's so friendly—and it's a lot of fun too!

Become invulnerable! Action Replay V.3 now has a SPRITE KILLER. Play weird games! The unique SPRITE MONITOR lets you save sprites from one game and load them in another! The mind boggles!

Sprite Control
Unique Sprite Monitor lets you disable them. Save them! Change them! Customise your games!!!

Picture Save
Unique! Save ANY Multicolour Picture, including title screens. Compatible with Blazing Paddles, Koala, Graphic Slideshow etc. Built-in Slideshow for tape users.

Disk Fastloader
Superb bonus feature loads five times faster. Takes up NO memory.

Code Inspector
Look at whole memory—program, registers, etc. Everything you need.

Compatible
Fully compatible with Commodore 64, 64C, 128 and 128D in 64 mode, 1541, 1541C, 1570, 1571 and Enhancer Drives, CBM compatible tape recorders, FastDOS, and Turbo ROM—can the others say that???

£29.99
GET MORE FOR LESS!
Buy Action Replay with DiskMate in ONE cartridge ONLY £39.99

THERE'S NO STOPPING ME NOW!

DiskMate Cartridge V.2

This is the way Commodore should have their DOS. Single keystroke commands: e.g. LOAD and RUN straight from directory, and much, much more! Works with all drives: 1541, 1570 and 1571.

- 2 minute complete Backup • Very fast disk functions • Invisible Toolkit • 10 second Format • Powerful 'Floating' Monitor • SAVE "Q" bug cured • Takes up NO memory • Unstoppable reset

£14.99
TERRIFIC VALUE

Buy DiskMate with Action Replay in ONE cartridge ONLY £39.99

Graphics Slideshow
View pix from games, graphic packages or loading screens singly or in sequence. 16 pictures per disk. Turbo load. Disk only. **LOOKING GOOD AT £4.95**

SPECIAL OFFER!
Enhancement and Slideshow on one disk ONLY £11.95

100% SUCCESS? WE ASK: WHO'S KIDDING WHO?

Action Replay V.3 will back-up ANY program which ANY other cartridge can't—and much more! It also has unmatched features. For instance, 'Freeze Frame' uses more disk space, saves SLOWER, has a SLOWER tape loader and has NO built-in disk fastloader, NO picture, NO Sprite, NO restart-features, yet costs £10 more!!! So, come on, who's kidding who? If Action Replay V.3 doesn't live up to our claims, return it within 7 days of receipt and you can have your money back!

Enhancement Disk

Get even more from Action Replay with this Bonus Disk to back up the new non-standard multi-stage loaders.

GREAT VALUE AT £7.95

Our cartridges carry a twelve month guarantee against mechanical failure.

How to get your DoSoftware

Please send cash/cheque/P.O. with order for fast despatch (SAE only for full details). Send off now to: DoSoft (Dept YC), 2 Oakmoor Ave, Blackpool, FY2 0EE

UK Postage included. Europe add £0.75, or £2 if order includes Blank Disks. Overseas add \$1.50 for Airmail, or £3.50 if order includes Blank Disks.

Amiga News

Expand your RAM

A two megabyte RAM expansion box is now available for the Amiga PC1000 from Robtek. The unit, which retails for £499, is compatible with all Amigas and plugs onto the bus expansion connector. For PC5000 users, a special interface is available for £19.95.

Books and Software Galore

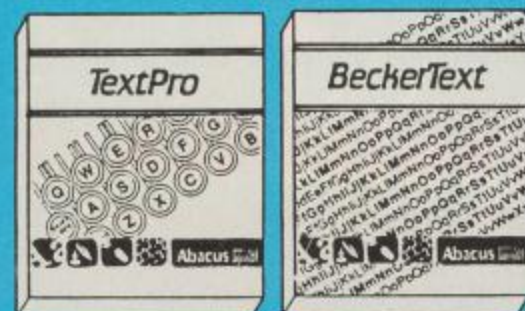

Users of Commodore's A500 and A2000 can now read all about it in four recent publications from Abacus.

Amiga Basic - Inside and Out will tell you all you need to know about programming the Amiga in Basic. Approx. retail price: £16.95.

Amiga Tricks and Tips will enable you to program a wide range of the Amiga's features such as accessing Intuition and making use of the advanced graphics programming using windows and menus. Approx. retail price: £12.95.

Amiga for Beginners will give the first time user an introduction to the Amiga and will cover the necessary housekeeping chores and the first steps in Basic programming. Price to be announced.

Amiga Machine Language is the guide for those who program in fast machine language and need to get to grips with the 68000 processor, address modes and instruction set. Price to be announced.

When you've had enough reading, consider the new range of productivity software packages from Abacus.

TextPro is an intermediate level wordprocessor which has been designed with fast entry in mind. The package features fast on-screen formatting, automatic hyphenation, the capability to include graphics with text, 30 user-definable function keys and flexible printer driver installation. Price to be announced.

BeckerText is a professional quality wordprocessor which features the additional functions of WYSIWYG formatting, multiple-

column printing, realtime online dictionary for type along spell checking and automatic index generation. Price to be announced.

Data Retrieve is a data management package which features pull-down menus which enable the user to quickly define files and enter information using convenient and flexible screen templates. Price to be announced.

AssemPro is a language development package which contains all the tools for writing programmes in fast machine code. Price to be announced.

Games Update

English Software have come up with a game that could fox the keenest snooker player with *Q Ball*. Imagine playing a pool game inside a cube, lining up shots in three dimensions and being able to rotate the table in 3D while you make your shot. If you feel you're up to the challenge that Hurricane Higgins might even stay

clear of, this game is for you!

Rainbird's Level 9 programming team have come up with a three-part fun packed adventure in *Knight Orc*. You play the role of an oppressed orc in a magical world of illusion and deception where you will communicate with other characters, learn spells and solve puzzles.

English Software's *Q Ball*

Level 9 Celebrating Knight Orc

Turn me On

A useful utility for Amiga users is an ON/OFF switch for the A500, which allows the power supply unit to be placed well away from the computer, allowing freedom of movement around your computer. The existing power inlet is simply plugged into the A570 switch and then the whole unit is plugged into the power socket - what could be easier? Price at £14.75, the switch is available from Lifetime Products, 22 Winston Avenue, Stocksbridge, Sheffield S30 5LA.

Forms in Flight

The Amiga Centre in Scotland continues its policy of importing some of the most interesting graphics software for the Amiga from the USA. The latest addition to its catalogue is *Forms in Flight*; a 3D drawing and animation utility. Objects can be drawn in both two and three dimensions and can then be viewed from any perspective or direction. The objects can be moved or rotated about any point to create animated effects with pan, roll, magnify, multiple light sources and hidden line removal all possible. But watch out, you will need 1Mbyte of RAM minimum to work this magic.

The £60 inclusive price tag is reflected in a large spiral bound

manual and a highly professional presentation. The software is menu driven. Playback supports low resolution with 32 colours and medium and high resolution with 16 colours. Plotters understanding the standard Hewlett Packard drivers can plot the objects, which are maintained in libraries, on paper. Details on 031 557 4242.

Forms in Flight

Games Galore

The Amiga is looking more and more like the natural successor to the C64 with a flood of new games available. MicroProse have promised us *Moebius*, a fantasy role playing adventure and Anco's 'budget' (in Amiga terms) range of £9.95 games is the first indication of more reasonably priced software.

Advertising Avalanche

Commodore are promising the computer trade an Amiga 'advertising avalanche' this Christmas. Advertising in the trade press has spelled out the advantages of the Amiga 500 over any rival home computer so there should be no shortage of shops to buy an Amiga from over the holiday period.

How do I get it?

It's alright us giving you an exotic address and ZIP code for some Los Angeles neighbourhood but how do you get the software? Well, you can either:

1. Check the ads - English Commodore dealers are importing more and more software all the time.
2. Try our contact addresses/telephone numbers.
3. Get in touch with Commodore UK who can supply you with a brochure full of goodies for your Amiga.

WordPerfect

We take a close look at what could be the ultimate word processing package for the Amiga.

By Anne Owen

The persuasive professionals from Sentinel Software recently took me through an extensive demonstration of WordPerfect, a wordprocessor whose functionality no other Amiga software package can match so far. The finished product should be available from your local dealer by the time you read this.

I had heard about WordPerfect on the IBM PC, the best selling wordprocessor – 15% of the UK market. I heard that Sentinel has target sales of three million pounds this year (you will have no trouble getting a £ sign on this wordprocessor – see below). I heard that WordPerfect was becoming a standard, number one in the charts, used *en masse* by Marks and Spencers no less.

I also heard that on the PC WordPerfect 4.2 costs £425 but that Sentinel employ twice the staff supporting WordPerfect users than selling it to the non-WordPerfect users. The Amiga version is WordPerfect 4.1 and costs £295. I also heard that there is an educational price of £76 for training (£135 for administration departments).

WordPerfect Family

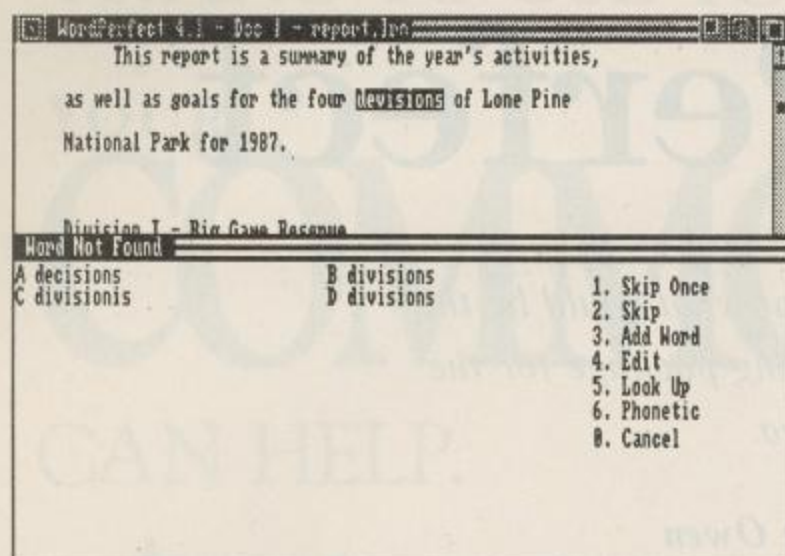

Sentinel are lucky, selling WordPerfect and the associated family of software products in the UK is 'fun' for them. Everyone in the company uses them and looks forward to the next package from across the Atlantic. The latest Amiga version of WordPerfect arrived to great excitement while I was visiting. If the Amiga family (especially the 2000) does well, then we Amiga users can also look forward to more software from the Utah based WordPerfect programmers. Current products include a spreadsheet and database.

WordPerfect Amiga takes its place beside Atari ST, Apple Macintosh and IBM versions in the PC field. The Amiga 2000 can, in particular, take advantage of the text file compatibility between different computer types. At the recent Commodore show, Sentinel had both Amiga and IBM versions running side by side in the 2000, one in the Amiga, one in the MSDOS task window. When you buy WordPerfect on the Amiga, you buy a product which is available on almost everything, including DEC VAX and PC networks.

Working with WordPerfect

WordPerfect has got every 'standard' feature you would expect of a wordprocessor. Each feature is accessed via pull-down menus and submenus – all with alternative (function) key presses – with all choices offered on screen. For instance, on selecting a search and replace on formatting codes, all the codes are listed on screen for you to choose. You are not expected to remember them or look them up. Substantial help texts can also be called up to explain any operation.

No requirement therefore to start with the manual whereas the more advanced features can be learned by using the tutorial disk and the manual together. WordPerfect, unlike some packages, is fully in tune with the Amiga environment. Just click on the disk icon, then the WP icon and you are into the full-screen text window, which can be

sized and scrolled like any other. A number of document windows can be open at the same time. The function keys are surrounded by a printed template with colour coding for the different key press combinations, e.g. SHIFT and function key. In this way a key can, say, activate a word count or go to a page number.

The programmers have cut down disk access to a minimum, meaning fast retrieval of file information. This is displayed in a window with ten options listed alongside. Files can be marked for selective operations such as delete, copy or printing (which is in the background from this window – in other words you can continue wordprocessing). 'Info' files are available but can be suppressed from the WordPerfect display. Files are sorted alphabetically and can be searched for a word match. They can also be protected by password. An 'ASCII check' provides a quick way of displaying the contents of a file.

The retrieve option adds the selected file to document so standard texts can be merged. Each document is held in 'virtual memory' which means that the text can be as large as disk storage will allow with text loaded into memory as required without intervention by the user. WordPerfect periodically makes a backup of your file in case of accident but documents also have to be saved at the end of a session.

Editing Text

Before describing some of WordPerfect's editing abilities, it is necessary to explain that each document has two elements. For each text that is visible on screen, there is a second text 'below' with formatting codes included. This second text can be displayed in the bottom part of a split window and can be edited in the same way as the 'top layer'. The codes look like this:

(Margin, Set:0,74)
(C)
(Hr)
(Tab Set:L15)
(TAB)

and affect the text after them until the next equivalent command takes precedence. As required, the user can get to know them and take precise control of the text at low level. For the great majority of the time these codes will be inserted invisibly as you edit a document, choosing linespacing,

centring, justification, hyphenation and so on. All style and formatting features can be generated with the mouse or from the keyboard. Differing line lengths, simply adjusted on the ruler, tabulation and bold and italic styles are shown on screen

Modifications to the text can be made by character, word, paragraph or marked block. Rectangular blocks can be copied, deleted or moved cut and paste style. As well as editing text over a single line length, you can type into columns across the page. The columns can be protected or 'newspaper style', where the text flows from the current column into the next column to the right of it.

Advanced Facilities

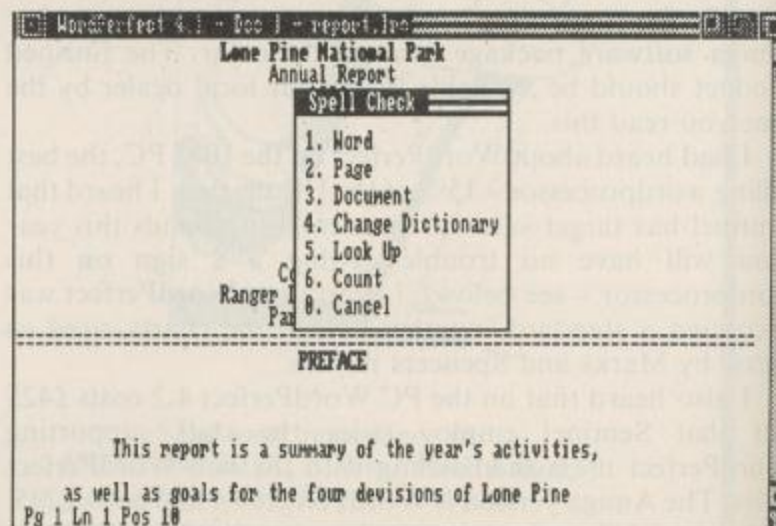

WordPerfect is plainly for the Amiga user who processes large amounts of text. For the product catalogue, information booklet or book, an automatic outline facility is available. Once activated, each paragraph is assigned a new number. Each new tab position gives a new level (and style) of numbering. There is a large range of styles to choose from, for instance IV, I, A, a.

Each page of WordPerfect document can have its footers and headers and a footnote generated as you write will automatically appear (with correct formatting) at the bottom of the page. A table of contents and an index, both with headings and subheadings and a variety of presentation styles, can be automatically generated by marking the required words.

For anyone who wants to incorporate straightforward maths into a document a type of mini spreadsheet is available within WordPerfect. Figures, formulae and descriptive text are entered into up to 26 tabulated columns. Subtotals and totals are displayed and any changes recalculated.

The mail merge facility is always a vital part of any wordprocessor. At its simplest level WordPerfect will merge a standard document with a list of alternative texts typed into WordPerfect itself. WordPerfect uses a set of special merge codes which are prefixed with '^' (CTRL). ^R indicates a record end in a merge list for instance, ^Q halts the merging process and ^C takes text direct from the keyboard. Text can be merged from a primary and secondary file with the results going to the printer or a disk file.

Macros repeat off-used keystrokes and WordPerfect will

record a set of keypresses like a digital tape recorder ready for replaying at any time, for instance from within a merge file. You must call the macro by the name you choose for the definition.

Spell checking has become a standard feature of modern wordprocessing. WordPerfect can check by document, page or marked block. If an error is detected then likely replacement spellings are offered for a quick click of the mouse. The checker can also pick up double words and numbers in words if required. A supplemental dictionary can be created from words unrecognised by the main dictionary and there's a program module to add it to the main dictionary if required. Foreign language options are available. The thesaurus compliments the dictionary with a vocabulary broken down into verbs, nouns, adjectives and antonyms (opposites). You can quickly move around alternative possibilities by clicking on them with the mouse.

Output

Printer features such as font, pitch, lines per inch super and subscripts, though not displayed, can be specified by codes in the text. The 250 printer drivers, as well as making Preferences look stupid, mean that, whether you use dot matrix, daisywheel or laser, there is in all probability a simple setup procedure for you. You can also build your own printer driver and assign any character number to any

printer code. For instance you can assign the Amiga internal character code 163 (the £ sign) to the code which generates that character on your printer.

Sophistication

For me the sophistication of WordPerfect is reflected in this sort of attention to detail: when you mark a block of upper case text and turn it into lower case, WordPerfect will, by default though not necessarily, retain upper case characters at the start of any sentence within the block. Marvellous! And if you get anything wrong there are three levels of 'undo'.

There are none of the desk top or form drawing features of some specialist wordprocessors, but WordPerfect appears to provide sophisticated and well-directed facilities without leaving the user behind. My brief acquaintance left me impressed and pleased that the Amiga's potential is beginning to be fulfilled by ambitious software, the power of which I have only been able to hint at in this article.

Availability

WordPerfect Amiga is version 4.1. It comes on four floppy disks with manual and keyboard templates. Price is £295. The Amiga Users Group is offering a £50 trade-in discount for Scribble! users who wish to upgrade to WordPerfect.

EXTERNAL 3.5" DISK DRIVE

- Slimline 1 Meg suitable for A500 or 1000
- Top quality NEC drive mechanism
- Throughport for Daisy chaining other drives
- Attractively styled ● Complete — No more to buy
- 12 months guarantee ● Fully compatible

ONLY £114.99 POST FREE
ADD (£5 for next day Courier delivery).

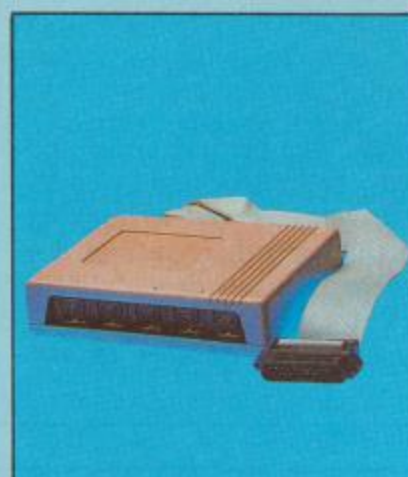

512K RAM EXTENSION ● A500

- Available with/without calendar clock option
- Simply plugs internally into a A500 slot
- Fitted in minutes — no soldering etc.
- With calendar/clock onboard time/date automatically booted
- Battery backed to retain time/date

ONLY £79.99 FOR STANDARD 512K CARD OR

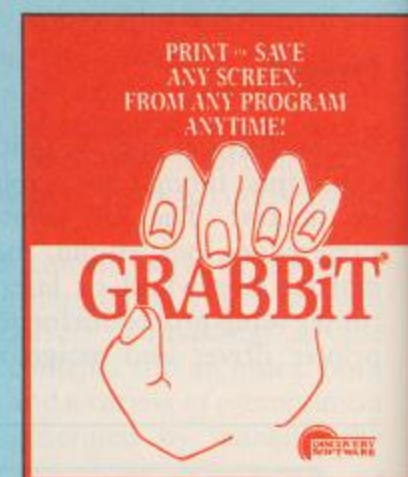

ONLY £89.99 FOR VERSION WITH CLOCK/CALENDAR

MIDIMASTER

- Full Midi Interface for A500/2000/1000 (Please state model)
- Compatible with most leading Midi packages (inc. D/Music)
- Midi In — Midi Out x 3 — Midi Thru
- Fully Opto Isolated
- No need to pay more — Full Midi standard

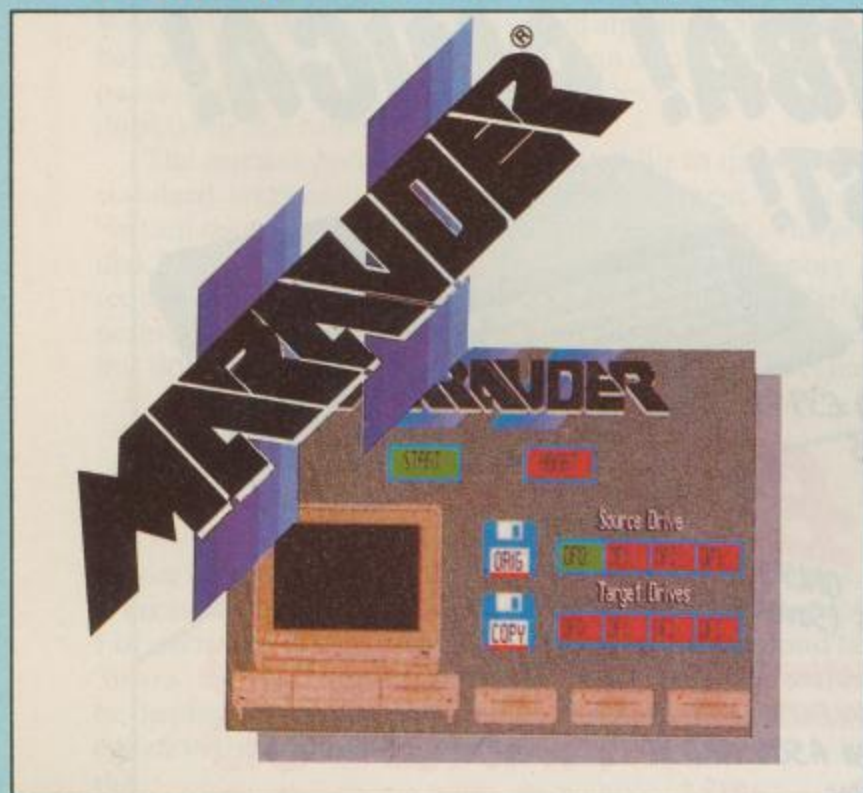

ONLY £34.99

GRABBIT

- Grabbit is a transparent Screen Grabber program
- Always there — simple key operation
- Drives dozens of Printers
- Requires only 10K Ram
- A true productivity tool!
- Very quick operation — does not require screen on during printing
- Free "ANYTIME" program lets you update your own colour palette preferences.

ONLY £21.99 POST FREE

MARAUDER II

- Quite simply the best disk copier available for the Amiga (all models)

- Superfast disk copier will copy almost any commercial disk
- Friendly user Interface — Mouse driven throughout.
- Completely compatible with Amiga multitasking system
- Even decrypts many encoded programs including D.Print/Video/ Paint/Music/II etc.
- Special 'Strategy Files' cope with even the most advanced protection schemes
- Supports upto 5 drives simultaneously for multiple copies
- Regular updates available — we always ship the latest
- Fast operation — typically around 80 seconds
- USA's top selling copier

ONLY £29.99 POST FREE

ALL ORDERS NORMALLY DESPATCHED WITHIN 48 HRS

Amiga Games

Another batch of games for the Amiga, old favourites and hot new properties jostle for places inside Your Amiga.

Cruncher Factory

Do you remember Pac Man? That seemingly easy game where you controlled the movements of a yellow, ball-shaped mouth that ate and ate and ate...?

After Asteroids, Pac Man was probably one of the first arcade games to make it big Stateside; it is probably the only arcade with a children's cartoon series to its name (thank God), and after setting off a whole genre of chase-orientated spin-offs, Pac Man sank into obscurity, occasionally popping up here and there in seedy motorway cafés.

Well, this time Pac Man has surfaced on the Amiga; called Cruncher Factory, this is not only Pac Man with all the bells and whistles, but it is the first Pac Man I have ever seen with the option to have two players playing at the same time!

The cruncher moves about the screen, eating the little dots and the larger green dots, which work as power pills, enabling you to eat the monsters for a short period of time. Sometimes a fruit appears and can be eaten for bonus points (unless the monsters get it first).

However, Cruncher Factory has a great deal more than its name might suggest. Because the Amiga has bags of memory, Anco have added features such as Random walls appearing in the middle of the game (often hemming you in at the last minute), 30 different and increasingly wicked mazes, and the option to design another 70 of your own!

These days, maze designers are becoming increasingly popular in games of this genre, and in the case of Cruncher Factory, it stops it becoming just another version of Pac Man. Now you can create mazes made up of your own name, or you can draw shapes, or you can even have an empty screen full of dots, with just the monsters to get in the way!

The maze designer uses the screens above level 30 for your own designs and while designing them can be a time consuming task, it is well worth the effort, as creating 70 original and interesting screens to play, or to pit your friends against, while the two-player mode, gives great satisfaction especially if they can't finish the screen as well as keeping the game from getting boring.

Other features include the ability to knock down the small walls that appear during the game, as well as being able to turn the monsters into Atari symbols (you can then add a little insult to injury by turning yourself into an Amiga 'bouncing' ball... now it gets personal!)

It's not that Cruncher Factory isn't an enjoyable game, it's just that without these little extras, Cruncher Factory would be just another Pac Man rip off, good for perhaps a few games, thankfully, Cruncher Factory is insanely addictive and I can't stop booting the disk up whenever I have a free moment to spare.

If you are looking for Pac Man on the Amiga, then this is a reasonable game; it doesn't make the most of the Amiga's graphics capabilities, but none the less, it is enjoyable.

Karate King

This game is a karate 'simulation' where the Amiga is used to create some stunningly beautiful backgrounds. Against which, you create utter mayhem while you battle it

out either against the computer as the Red Fighter, or 'between friends', with an opponent.

The mouse is not used with this package, and a joystick is required for all sixteen moves. The Amiga handles the graphics with such ease that the red fighter seems to almost sweat as he lunges at you with some pretty nasty kicks.

The sound effects are very good, with sampled shouts and cracks, and a few good groans as well. The problem is that I don't really know what I am fighting for! The immediate aim is fairly simple though – to knock the red fighter unconscious so that you can move onto the next screen.

After each bout there is a short interlude as some unseen opponent throws boulders at you from the sides, which have to be demolished before you can move onto the next screen, and exactly the right move is required to shatter these into pieces.

This is a good combat game, with some very clean graphics and some nice music to boot (pun intended). All nine screens are beautifully presented and although the game is very difficult in the first three or four screens, it does not get as difficult as would be expected after level six has been reached.

The joystick in port two controls the white fighter. The red fighter has the advantage of being more powerful than the white fighter, and at higher levels he also has various killing devices at his disposal, including shuriken, throwing darts and so on...

As you progress, it seems that some types of punches are more effective than others. For instance in the first level, you can use just about any blow you wish, but in the second level a kneeling punch or a low kick seems to work wonders!

If you are defeated by the red fighter, a couple of birds fly over you and your opponent (probably still comatose on the floor) with a banner proudly proclaiming his superiority. They fly off and it's time for more mutilation and mayhem... all good clean stuff.

Karate King is the best version of this sort of game I have seen running on any machine and the ease with which the Amiga presents each movement forces envious looks from all the non-Amiga users I have played this game with. This would make an ideal first time purchase for any new Amiga owner wanting some hack and slay software to while away a cold evening.

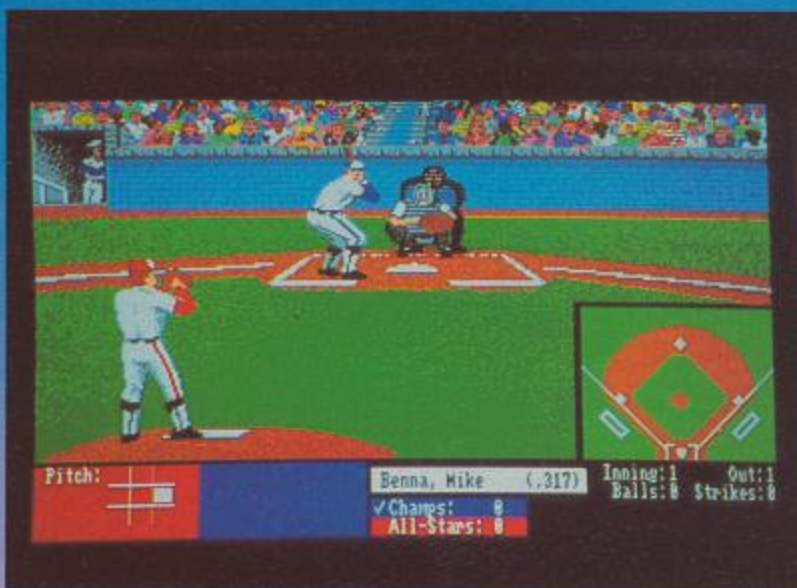

C.G.

Touchline:

Name: Karate King. **Supplier:** Anco, 35 West Hill, Dartford, Kent DA1 2EL. **Tel:** 0322 92513/8. **Price:** £9.95.

Originality: 7/10. **Playability:** 7/10. **Graphics:** 9/10.

Hardball

Imagine you are in the good old US of A and you are at a major league ballpark just before most of the fans have arrived. The sun is shining and the hot dogs have been cooking all summer; you find yourself a seat with a good vantage point (let's say just behind the batter) and you sit down ready for the day to begin.

Accolade Software have really gone to town on the packaging for this one. Hardball is a game that has not only captured the essence of a major league baseball game, but I believe, will successfully make the transition from America to Britain with consummate ease.

Hardball – in America – is a game that is played on a pitch like rounders, using the scoring of cricket, and has the popularity of football; add to this the tactical strategy of a small (and paranoid) South American country with a large nuclear arsenal, and I think you'll get the gist of this slice of American pie.

So, kitted out with baseball hat, a six pack (of cherry Coke) and my Amiga, I booted up the game and prepared myself for a whole new experience.

First of all, you are given the option to use either a mouse or a joystick. You can play Hardball against the computer, against friends or even set the Amiga to play against itself!

From here on, you are going to have to know a number of things. Firstly, you are going to have to know how to play baseball. This isn't too difficult, as the game is essentially the same as rounders (i.e. hit a ball and run like hell!) but unlike rounders, there is an umpire behind the batsman who decides whether or not the ball is in the 'strike area' (for more information, just see the hilarious 'Bad news Bears' film which is, incidentally, all about a bunch of losers in the league, and you'll soon pick up on how things work in the game).

Another thing you will have to know is the ability of the

team you are currently waging war against. The tips in the back of the handbook are reasonably useful – should you happen to know baseball jargon – but the best way to get to know an opponent is to see how he reacts to a pitcher's throws, and this is where pen and paper come in useful.

Play begins with the pitcher's screen, depicting the pitcher, the batter, and the well-protected umpire. You are looking from the centre field and are able to control either the 'Champs' team or the 'All Stars'. If you are the team batting, you simply decide which is the best type of strike to attempt (don't forget you don't have to try to hit a ball – if you don't think you can hit it, the umpire usually agrees with you!).

You give the ball a great big whack and you run around the pitch, passing as many of the bases as you can. If you get there before the ball, then all is well; if you don't, then you are out, and the crowd squeal in delight – nice to know where your friends are!

Pitching is even better! You select which is the best (or rather worst) throw for your opponent (i.e. can you get the ball past him three times, with the umpire calling 'strike' each time?). If the batter hits the ball, the screen clears to display the field, and the ball slowly arcing over to one of your fielders. You, with mouse in hand, then take on the role of fielder and move the closest player to meet and catch the ball, and then throw it on to the next base on from the runners – like rounders, you are to try to get the ball there before the runner, and so catch him out.

The attention to detail is amazing! In the corner of the screen is a Bazooka Joe, propped up against a wall eternally blowing gum. The crowd murmurs excitedly between pitches, and cheers wildly whenever anything gets hit. The sound as the bat strikes the ball is very realistic – a wonderful 'crack' that could have inspired Sir John Betjeman's 'sound of leather on willow' quote.

The animation is very smooth, especially when pitching the ball, or when you are batting; and when the scene changes to the field, you can run about with the selected fielder flashing on and off until he throws the ball. As a batter races against an approaching ball, they slide into base in a cloud of dust and gravel... great stuff!

Substitutions are easily made, should you find a man beginning to wear under the strain of being active in the field for too long, and should you work out the playing tactics of a pitcher or batter, then you can improve your chances of beating him by selecting a more suitable opponent, so there's quite a bit of thinking to be done as well as playing.

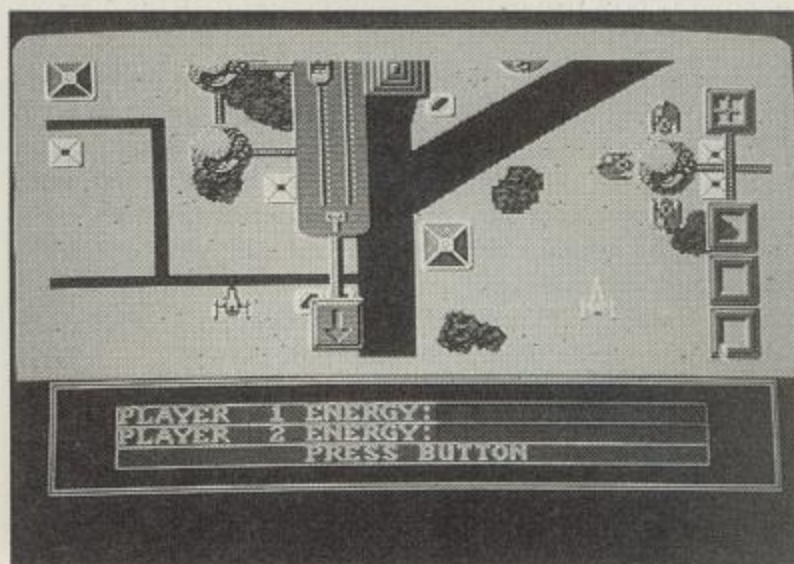

Hardball is an amazing game; it is delightfully free of violence, and it has captured not only the competitive spirit of the game, but also, I believe, the atmosphere of the ballpark, the excitement of the crowd and the smell of those lovely sizzling hot dogs!

C.G.

Touchline:

Name: Hardball. **Supplier:** Accolade, 20833 Stevens Creek Boulevard, Cupertino, California 95014. **Machine:** Amiga 512K.

Originality: 9/10. **Playability:** 8/10. **Graphics:** 8/10. **Value:** 9/10.

Challenger

Another one of Anco Software's 'silver' range of software packages for the Amiga. The aim of the game is to collide as little as possible with the objects at the upper (grey) level and the lower (green) level on the screen. Player one uses a joystick, plugged into port two, which is used to control the speed at which the green background scrolls past and determining the rate at which the blue ship moves forward. The computer, (or player two) controls the rate at which the grey background scrolls past, as well as the flight of the green ship, if played in 'two player' mode.

The players pilot their space ships and try to avoid colliding with either the landscape or the grey level, as each impact causes an energy drain. If the way ahead is clear, you simply accelerate, hopefully causing your opponent to collide and explode. The upper level is filled with a latticework of anonymous, nondescript grey buildings, occasionally labelled 'land here' (you can't), the lower with trees, shrubs and more small buildings. After the third, 'underwater' level, the game improves a little – but not much, and certainly not enough to distract you from wondering how the spaceships got underwater in the first place.

Challenger is essentially a 'dodge out of the way' game with eight different levels. The problem is that there is very little substance to the game, as all that you are doing is dodging out of the way whenever an obstacle in the lower or upper levels approaches. A basic explanation or scenario of the type often found in accompanying novellas might have relieved this, as at least there might be an underlying goal. As it stands, twelve lines of instructions are clearly not enough.

Instead, the game revolves around the one (or two) spaceships, which are controlled by joysticks; note that neither the mouse nor the keyboard are used here, which is unusual, and annoying, in that not all users will have joysticks for their Amiga, and this will seriously limit the game's appeal.

Playing the game is a rather unenjoyable and boring affair as you are simply avoiding the trees and bushes and the various ground based buildings, while keeping an eye out for

the upper 'grey' level buildings that seem to sweep past you, and anyway how can buildings travel faster than the ground they are supposedly supported by?

One interesting aspect of Challenger is the method of scoring. For instance, I was starting a new game when I suddenly abandoned the joystick, allowing the ship to carry on unaided for a short while, until it ploughed into something that can be best described as a runway with 'land here' proudly emblazoned on it (I told you, you couldn't)! The high score table told me that this was worth 64,334 points, whereas a controlled flight lasting a good few minutes was worth only a few hundred points!

Now either I'm going crazy, or there is something seriously wrong with a scoring system that takes absolutely no account of flying, dodging or tactical skills whatsoever!

Playing against the computer is even less enjoyable, as nothing new happens. The sound effects are virtually nonexistent, while the ships themselves are unimpressive. They consist of one dimensional objects that do not fit in with the otherwise well-designed graphics, nor do they look anything like the ship in the loading screen. Even the explosions are unsatisfying!

The loading screen provides something of an anticlimax in that the long list of credits seems to promise more from the game than it actually delivers. I am well aware that this is a low price game, but the waste of the Amiga's facilities is reprehensible, although Anco have proved, with games such as Karate King, that they can provide excellent software for this machine, that utilises its capabilities to the full. Software of this ilk usually tends to be restricted to free distribution among user groups and public domain libraries.

All in all, I would give Challenger a miss, unless, of course, you have money to burn.

Brian Clough's Football Features

Well the Americans have had it their way with Hardball but CDS Software have converted a popular program across to the Amiga which offers a little bit of English culture for this primarily American machine.

Brian Clough's Football Fortunes has the unusual approach of being probably the world's first computer game that plays side by side with a board game. It is suitable for two to five players and each player takes on the role of a football club manager.

The object of the game is for each player to successfully steer his team through the season, using his skill to make the team stronger as the games proceed. Each manager competes against both human and computer controlled teams in a ten-strong first division for the league championship and, of course, the FA Cup. From the second

season onwards, each team will compete towards the European competition, through the usual practice of league champions going through to the European Cup, the FA Cup winners going through to the European Cup Winners Cup, and the remaining clubs going on to the UEFA Cup.

The winner of Brian Clough's Football Fortunes is the manager who survives to the end of the game and has the highest number of game points. Game points are those awarded by the computer and are based on each manager's performance in the league cup competitions, and on the amount of raw cash he has managed to accrue and, more importantly, retain, by the end of the game.

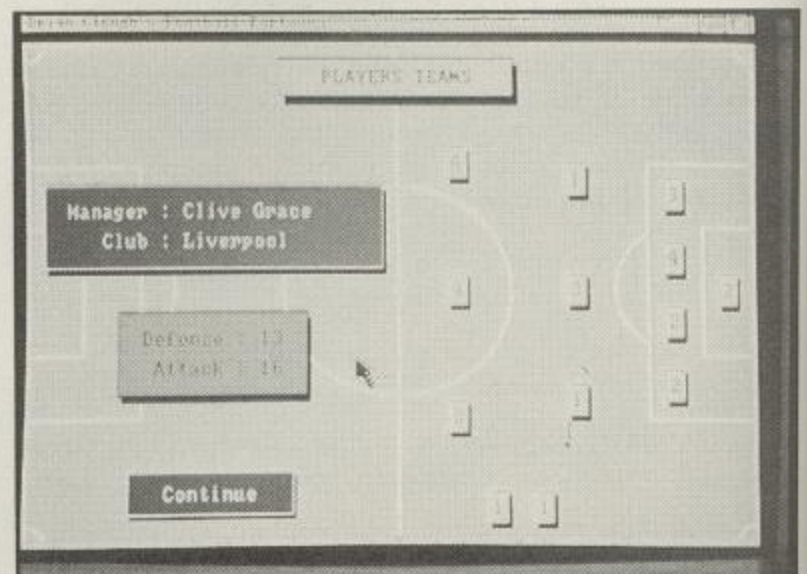

Sounds familiar? You bet it is! Brian Clough's Football Fortunes is simply a well presented and very enjoyable variant of the old board game of Monopoly. The main aim of the manager is to create as strong a team as possible, by increasing the star rating of his side. However while doing this, he must not neglect any section of the team or he will lose matches, nor must he overspend as the scales of fate sometimes tip unfavourably - often at a time when you could really do without the extra hassle.

Ah well, such is the stuff of which football managers are made, and if you can look after your bank balance while retaining your star players, then you could go far.

Footballers are purchased from other football managers and a player can also obtain star material from Auctions. This must be done shrewdly and with skill - yes we would all like a world cup goal scorer in our teams, but unless you can survive buying him, and you gain the results you expect quickly, then you may just as well have thrown your money down the drain, as a foolish purchase can cost you your job - and nobody knows more about getting the boot than Brian Clough!

The game is more or less managed by the computer, but don't think this is a quick 30 minute-to-play job, as playing Brian Clough's Football Fortunes can take anything from a couple of hours to a whole afternoon, depending on how many people are playing.

The computer doesn't do all the work for you; it provides lists of forthcoming fixtures, the current league table, details of points scored by both clubs and managers throughout the game and the chance cards allotted to players, as well as the all important printout of results on the screen at the end of each league game. This is in the same way that the results are presented at five o'clock every Saturday afternoon during

the football season, but you do need to look after the way cash is spent, as well as making sure that the pitch does not fall into disrepair and that occasional refurbishments are made as required.

After each match, the manager can receive his gate money from the banker. He will be given half of the amount shown by the monitor, and the size of the gate receipts depends, of course, on the league positions of the teams playing any given fixture. For example, playing a top flight team could be a big pay-off for all concerned, if the two teams were well matched. However, if you are scraping around the bottom of the league, then I wouldn't recommend breaking the bank trying for the summer tour of South America!

This is an excellent strategy game – probably one of the best of its genre as it requires methodical thinking and almost brutal planning ahead, but then that's life at the top!

Brian Clough's Football Fortunes is also an unusual game in the way that it brings the players together more than if it were, say, a completely computer orientated game. The graphics are nothing special, being mainly rather chunky – but colourful – menus, but then managing a football team gives you more to think of than mere frivolities.

Full marks must go CDS software for their packaging of Brian Clough's Football Fortunes; the 'funny money', the cards, the board and the instructions all come together to make an excellent package – perhaps not family entertainment, but a great way to amuse your friends for an evening. Oh, and if you should have any problems regarding the game, there is a special Brian Clough's Football Fortunes hotline set up by CDS software. Now that's what I call dedication!

Balance of Power

If you enjoy a mental challenge, against human or computer opponent, then Balance of Power, Mirrorsoft's Mindscape strategy game of geopolitics, will not disappoint. The game puts you in the shoes of the American President or the General Secretary of the Soviet Communist Party. Your judgement and temperament will determine the outcome of an eight-year long cold war. The object is to win prestige and influence in the global sphere, without instigating a holocaust – the ultimate failure in B of P. A score is maintained and can be viewed at any time.

Each year you support insurgents against the enemy as well as political allies under threat, with both economic and military aid. These hotspots are where each opponent can throw down the diplomatic gauntlet and may begin a crisis. You must decide when to back down as well as when to stand firm.

The local scenario will be recognised by anyone who reads the foreign news in the paper. Indeed B of P has its own newspaper reports, as well as private information sources on minor countries and on the super power combatants. USSR and USA actions for each current round (a year in game terms) and for past years is also available.

This variable information is combined with a large collection of static data about all the 'countries' represented on the B of P maps. The maps are what make the game; offering information quickly and attractively in association with pull-down menus. It is fun just clicking the mouse on different countries to gather information about the economy, population, GNP and military spending. There are details on education, health, violence in society and political inclination. Data goes right down to the number of televisions or telephones per capita.

Your first eight years of negotiations is just for beginners. The intermediate grade introduces the subversion of foreign governments, Coup d'Etats and the new policies of economic aid and destabilisation.

The expert level introduces treaties based on diplomatic, trade or military co-operation and the pressures that can be brought to bear by large on small through these means. The aim here is to prevent the 'Finlandisation', i.e. going over to the other side of the allied countries. The 'nightmare' level is the same as expert but with the odds shortened for the human player against the computer or for one side in the two player game.

B of P requires a well presented manual containing plenty of background to the game and its underlying rules. It's a tough game to play and its detailed design is enthralling. And it doesn't matter which side you choose, only a cool head and the ability to learn from your mistakes will see you through.

This is another highly priced software package but I won't complain because there are hours of enjoyment here in a very nicely produced game.

The Desk Top Video Market

By Anne Owen

Many people believe that the Amiga is going to dominate the Desk Top Video (DTV) market in the way that the Apple Macintosh has cornered Desk Top Publishing. Software packages are emerging which allow microcomputer graphics and video to combine powerfully, both at professional and amateur levels.

3D on TV

Aegis, already renowned for their graphics software, such as Animator, on the Amiga, have released the \$199.95 VideoScape 3D graphics and animation package. Aegis are pitching it against expensive professional software like Digital Art's DGS system and Cubicomp Corp's PictureMaker.

A minimum of 512K is required to generate 'television quality graphics', although Aegis suggest 2Mbytes and a dual drive system or hard disk. The software consists of Designer 3D, created by Colin French, for making 3D objects; PlayANIM, created by Gary Bonham of SpartaFilm, for playing animations back in real time; and VideoScape 3D, created by Allen Hastings, for making finished videos. There are also utilities for creating common geometric shapes such as spheres, cones, rectangles and fractal landscapes.

3D objects are created either by numeric entry of X,Y,Z co-ordinates or by one of the supplied utilities or by point and click with the mouse. With D3D, there are three windows representing front, side and top views

of the object. Scaling, numeric value display and numeric entry help maintain accuracy as the object is drawn. When finished, a motion file can be loaded and the object is passed to the preview window. In real time, the object can be shown in motion from all sides. Each frame of the motion file is recorded in RAM and played back at an adjustable speed.

Once the objects are created, they are loaded into VideoScape's main control panel. Here, the scenes are put together. Details regarding camera and object motion, backgrounds, foregrounds, horizon and other information are determined, and a complete scene is created. At this point a video cassette recorder can be hooked up to record the scene one frame at a time, or a few seconds at a time using the PlayANIM module. Frames can be previewed either manually or automatically at any time, and their settings can be changed on the fly.

To create an ANIM file requires at least one megabyte, although they will play back in 512K. An ANIM file can compress a 40K frame into less than 1K. Jeff Bruette, computer graphics expert and Richard Lewis, production designer for Max Headroom, are using VideoScape 3D to create background logos as well as some on-screen wire-frame animation for the well-known show. So watch your screens.

Animator's Apprentice

Animator: Apprentice software, written by Hash Enterprises is

designed to generate frames for animation in 4096 colours. The Apprentice costs £195.00. Two dimensional images are turned into 3D sculptures by 'Sculpt'. Character movements, called 'actions', are defined with another interactive module and are applied to the objects in 'Director'. Here characters are positioned, the light source and camera focal length set and the scripts written.

Each frame is generated automatically, taking between five and twenty minutes (which is quick!). When finished the frame can be recorded to video. Playback of frames in near real-time on the Amiga is also possible.

Animator comes into the category of organic animation and is strong on representing people and animals with naturalistic shading. It is for the budding Disney who wishes to put together story-telling with characters rather than logos, fly-bys or mathematical shapes.

Martin Lowe, of the amiga Centre Scotland - who market Animator in the UK - has distributed what must be the definitive list of software requirements for Desk Top Video:

1. Extensive graphics and sound capabilities.
2. Genlocking capability (for mixing video and computer graphics).
3. Overscan (no screen borders).
4. Real-time playback so that editing can be done on home video recorders.
5. A titler program

6. A HAM (hold and modify) in 4096 colours paint program.
7. A Video digitiser for inputting pictures into the computer from a video camera.
8. A 32 colour paint program.
9. An 'organic' 3D animation program.
10. A 'mechanical' 3D animation program.
11. A special effects program (wipes, screen splitting, etc).
12. Other animation programmes which perform specific feats (such as water, clouds, mirrors, etc).
13. A mouse or tablet for artistic input.
14. An editing video recorder.
15. A 2D animation program.
16. an audio digitizer.
17. A music program.
18. A sound synthesis program.

I'm sure you can identify some of the software and hardware above; the majority of which is now available for the Amiga. If you have ideas of your own about combining Amiga and VCR don't keep them to yourselves, drop us a line. A professional setup with all the above would cost an arm and a leg. At home you can start out with some good animation software

with real-time playback, a home VCR to record the screen and a cable to plug them together.

Ray Tracing

Following the popularity of Eric Graham's Juggler animation, ray tracing could become this year's computer fad! Eric's ray tracer software is available from Amiga Centre Scotland, but beware because it isn't an animation package, it only generates a single frame at a time. Eric is working on an animator for his ray tracer generated images but in the meantime just putting together your own picture is a fascinating exercise.

To create a picture, the positions, size and colours of the spheres and lamps (light sources) have to be defined in a data file. The program ssg processes the input file, puts the resulting image on screen and sends it to a specified output file. The finished files can be more rapidly displayed by the ss program. This is just as well because the original takes an age. In fact one of the useful options you can set from the command line when you call ssq is the picture size. A small, and

more quickly generated, version can be used to check your input data. Other options available include a vertical format picture and anti-aliasing (blurring at the edges).

The input file contains the position of the observer, the direction that the observer is looking, the focal length of the observer's camera lens, the objects – a series of spheres, tubes and chains – the number of lamps, the specification of each lamp, the colour of the ground, the diffuse illumination and the sky.

The software is supplied with full documentation, some finished and an example ray tracer file ready to be worked on.

Summary

The software mentioned above ranges in prices and power. You can try your hand at ray tracing from £11.50 – why not send us your results to share with other Amiga owners – or you can invest heavily in DTV by purchasing both Genlock hardware from Ariadne Software and programmes such as Videoscape – for 3D – or Animator – for organic – animation. I can't wait for the first Your Amiga video!

The Best Software from HiSoft

Devpac Amiga

The Editor

Type in your assembly language using the integrated screen editor which runs under Intuition and uses the full window and mouse environment. Everything you'd expect, block operations, search & replace, flexible tabs *plus* a goto error command to make program correction even simpler.

The Assembler

GenAmiga is the assembler which can assemble source code at roughly 25000 lines per minute, directly from the editor. Full expression handling, up to 16 character labels, Motorola-style macros, conditional assembly, disc inclusion, output of linkable code for ALINK/BLINK (supplied) and much more.

Special Offer

Just cut out this box and return it with your order and you can claim a £5 discount (normal price is £59.95) plus receive a *free solar calculator*. Simply send £54.95 to us at the address below (you can pay by cheque, Access or Visa) and we will despatch your Devpac Amiga by first class post.

The Debugger

MonAmiga is the symbolic, front-panel debugger with built-in disassembler. All the usual features like multiple breakpoints, single-step etc. are supported plus sophisticated search capability, multi-tasking and a backup screen so that you can see your program's output independently of MonAm's display.

Devpac for the Amiga comes with a full, ring-bound manual with tutorial and the Motorola 68000 Programming Pocket Guide.

HiSoft The Old School, Greenfield, Bedford, MK45 5DE. (0525) 718181

Amiga Promise

*Now, there's no excuse for poor spelling,
and that's a promise!*

By Anne Owen

Promise by 'The Other Guys' is a stand-alone spellchecker for the major Amiga wordprocessors, boasting a 95,000 word dictionary, a spelling helper and a punctuation checker. How do these features match up to the task of keeping your copy clean?

Because spell checking is a necessary evil rather than an entertainment, I am happy to say that Promise does not mess around. A simple file display with click/requester boxes for drives and directories is used to select the file for checking. In a similar fashion 'custom' dictionaries (those you have created yourself) can be loaded into RAM, where they merge and are used in tandem with the main dictionary to check the selected text file.

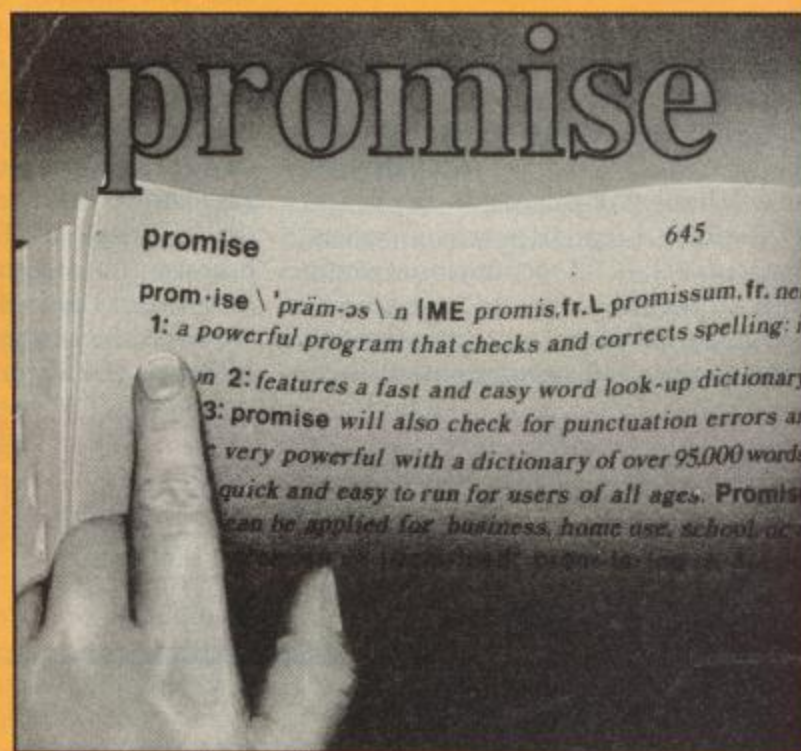

When activated, Promise rapidly detects any words unknown to it (not necessarily incorrect) and prompts you to either correct the spelling or go on checking. You can specify whether any change or ignore should apply 'just this once' or for 'all occurrences'.

Any word which is unknown to Promise can also be added to the custom dictionary which can then be saved in its amended form for later use. When correcting you can make use of the 'help with spelling' feature. You just click on one of a number of suggested words which are listed in Promise and your selection is exported as the correction.

The 'Spelling Helper'

A close relation to the above is the separate 'spelling helper' which can be opened as a task on its own and used while writing (or doing a word puzzle, crossword, etc). You can look up spellings and words using wildcards in place of the letters you are unsure of, e.g. pr???? finds all seven letter words beginning with pr; rec???ve will find the correct spelling receive; * is substituted for any part of a word, e.g. p*c*t*ry which is unknown. Great for Scrabble cheats!

The punctuation checker works alongside the spellchecker when activated and finds punctuation which does not correspond to its basic rules. A correction is suggested which can be accepted or refused as with spelling. Promise checks for double punctuation marks (usually a typing mistake), lack of a space after a punctuation mark, commas and full stops outside quote marks and colons and semicolons inside quotes.

I discovered to my surprise, that our review version of Promise did not operate correctly with Kickstart 1.2 or 1.3. Only my old 1.1 on the A1000 got me going so check with Robtek, the UK suppliers (01-847 4457) on compatibility with your system before buying. If you can get going then Promise is excellent for batch checking files and really comes into its own when instantly available in its own hard disk directory. The manual explains each operation, including backing up and hard disk installation in a step by step manner so there is no room for misunderstanding.

Because wordprocessors/text editors like Textcraft, Edit or early Scribble do not have spellcheckers of their own, Promise can do a good job filling the gap, though at a fairly high price. Prowrite files have a number of codes embedded in them so Promise is not really suitable. If you use Scribble! II or have invested in WordPerfect then Promise offers nothing over and above the excellent checkers you already possess.

Touchline:

Name: Promise Spellchecker. **Supplier:** Robtek Ltd, Unit 4, Isleworth Business Complex, St. John's Road, Isleworth, Middx. **Tel:** 01-847 4457.

Book Review

There's no need to be bogged down with heavy reading when you're learning about the Amiga. A recent publication from Ariadne seems to have provided the answer.

By Clive Grace

The Amiga is to many people a closed machine; there are no advanced reference manuals readily available to the first time user, and the massive four volumes of the 'Technical Reference Guide' published by Addison Wesley is considered heavy weight reading matter and is really only suitable for the machine code programmer who is already adept at programming in the Amiga's native tongue.

The 'Kickstart Guide to the Amiga' is, by contrast, a smaller tome. Published by Ariadne Software, this large format paperback book has 250 pages and contains so much information, I had to put the book down every ten minutes to stop myself getting overwhelmed by the sheer mass of information.

The Kickstart Guide is written from the point of view of the serious software programmer who has, for the first time, delved into the world of 16 bit computers only to be confused by the extra memory and facilities that the Amiga has over other machines in its caste.

The book is roughly divided into three sections; part one is an introduction to the Amiga, and I couldn't wish for a more comprehensive introduction to the general hardware. It satisfies the craving for more information after devouring the BASIC reference manual and the Amiga 'Welcome' manual for the first time.

The opening chapter serves to explain the 68000 processor, its interrupt handling facilities and its rather over-indulgent register handling system. The introduction explains how the 68000 fits into the Amiga's working environment and where necessary, it pulls comparisons from the more familiar world of the 6502 processor, so users upgrading from their C64's or C128's will find it easier to understand the complex interrupt facilities the 68000 has to offer.

The second section is divided into five smaller sections, and attempts to explain I/O streams, how to access various devices and setting up a few virtual ones of your own. This chapter goes on to setting up multitasking operations finishing off with an intriguing chapter called 'Serial port debugging, and the Joy of Whack' - sounds like fun!

Have you ever wondered what those numbers are at the end of the 'Guru Meditation' message? The Kickstart Guide not only tells you how to translate them, but also explains when an error is an operating system crash, a hardware fault or an applications bug, and there are ways of retrieving information after the Guru has meditated. Ommmmmmmm.

The Amiga's famous graphics capabilities are uncovered, possibly for the first time, and the book goes

even further by discussing how the graphics can be more freely accessed through the Amiga's 'copper' co-processor hardware, and introduces us to the special custom chips named 'Paula', 'Angus' and 'Denise'. These chips can be used to obtain beautifully fluid computer animation by synchronising the blitter and bimmer chips to the screen 'flyback state'.

The third section is an introduction to 'C', and promptly pushes you off at the deep end into programming with arrays, strings, data pointers and all of the most useful things you will need when programming in a new language for the first time.

While this section does not purport to be a definitive description of 'C', I would, however, recommend this section to programmers wishing to sample the delights of this powerful programming language for the first time. It does jump ahead of itself at times, but with a little note taking, many of the initial questions regarding 'C' are answered. Interestingly enough, the style of the manual becomes less chatty, underlying Ariadne's serious commitment to the 'C' language.

There are quite a few examples in 'C' short enough to go through without resorting to buying a 'C' compiler, but as many of the serious programmes and games are written in 'C', it seems sensible to think of 'moving up' to 'C' at some point or another.

In all, 'The Kickstart Guide to the Amiga' is competently written in a friendly style without too much rambling on about how 'amazingly wonderful the Amiga can be, if only you could program the damn thing.'

The most important thing about this book is that it is written in a style that is very alluring, moreover, it inspires confidence in the programmer and while this initially leads to a few monumental mistakes, it also puts you on the road to experimenting with the Amiga, which is a good deal more interesting than just pushing the mouse around your desk... although that can be fun as well.

This is an excellent book and necessary reading if you have an Amiga; be it a 1000 on A500 or even the A2000. If you are thinking of getting an Amiga then this book may just tip the balance, I can't imagine what my Sunday afternoons were like before this book!

ProWrite

*New Horizons have come up with a
wordprocessor with a difference –
ProWrite offers colour, high resolution
and graphics in text.*

By Anne Owen

First impressions are always good with New Horizons software, the packaging and manuals are up with the best for any micro. ProWrite's 'fold flat' manual is especially friendly, pitched at the beginner but with full index, glossary and feature by feature explanations. Request boxes and menus are printed alongside text for ease of recognition and there's a beginners' tutorial incorporating one of the three examples of text on the disk.

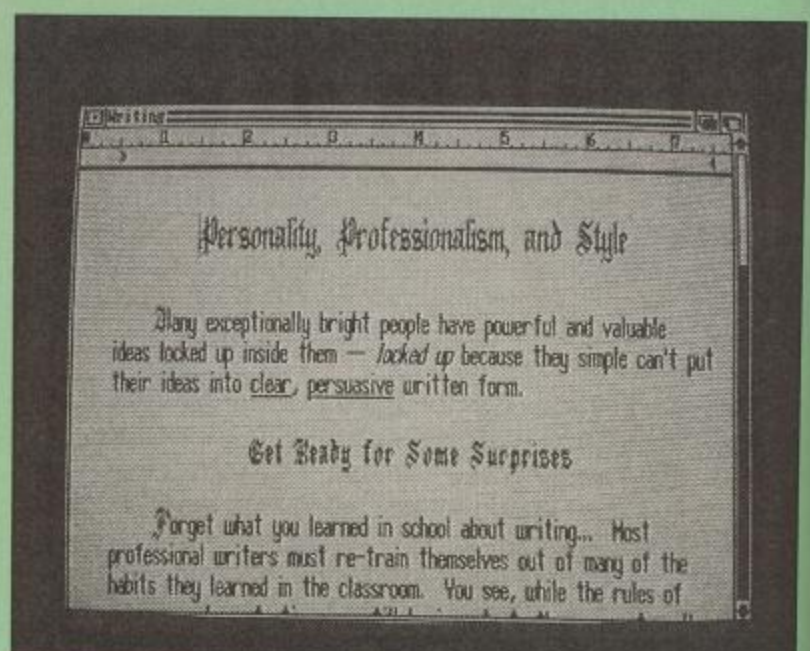

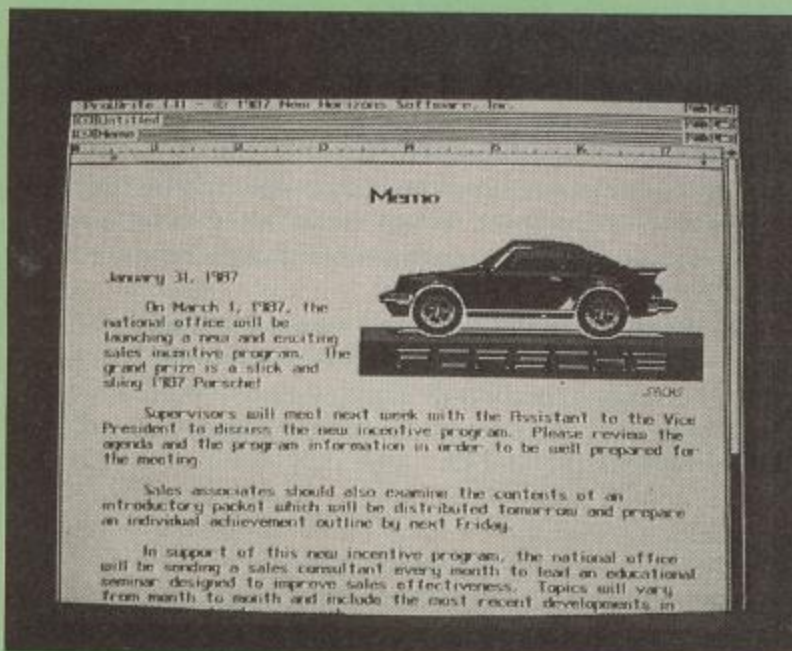

Different breed

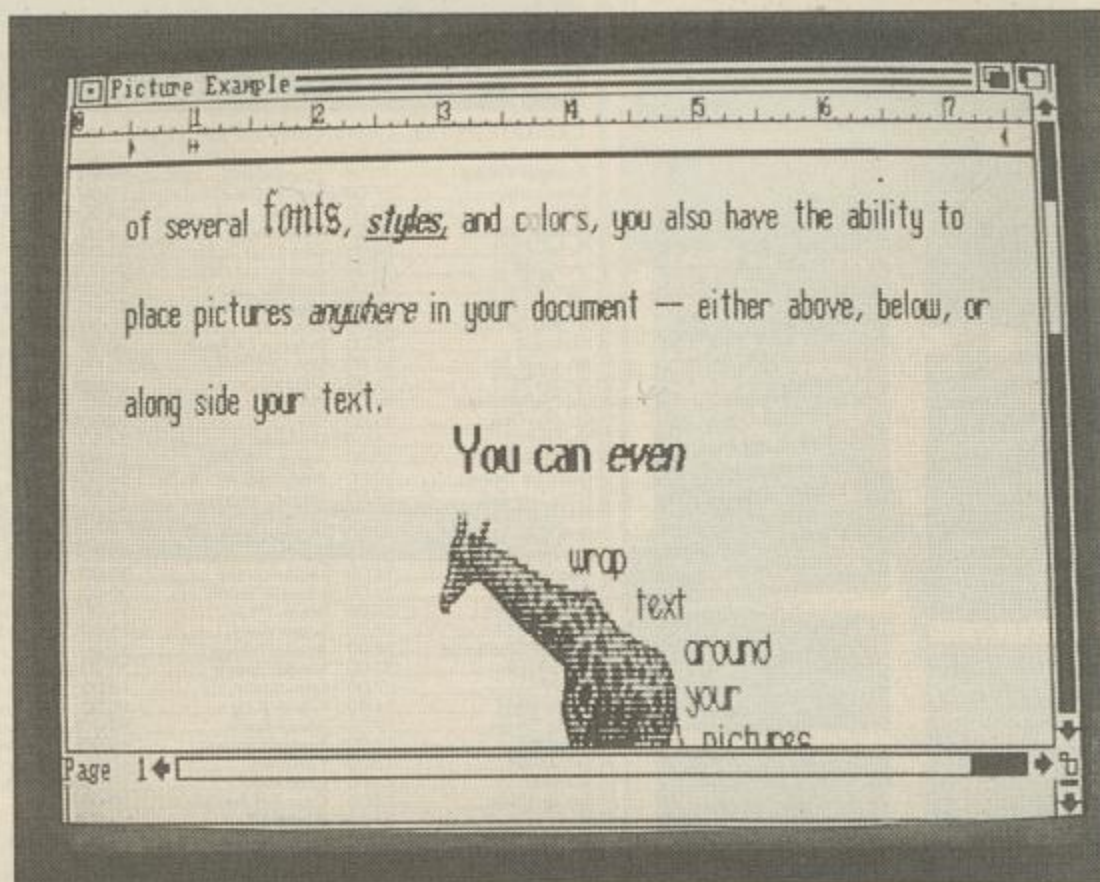

ProWrite is different enough from any rival software to prompt the question 'what do you want from your wordprocessor?' Personally I decided I wanted high resolution (interlace mode) but I couldn't cope with the flicker on my 1080 monitor. ProWrite's default background colour is paper white and a dimmer (SHIFT/HELP) is provided with cuts down flicker a little. Also recommended

is the product Jitter-Rid, a screen which fits over the monitor but I didn't get the chance to test this out. The best and most expensive answer is the Commodore 2080 long persistence monitor. I soon renamed the medium resolution version of ProWrite as my default ProWrite to boot up into.

I also decided I like colour on screen. There are seven to choose from, corresponding to the seven ribbon colours available on a colour dot-matrix printer. The standard fonts and three others, Granite, Marble and Serpentine (12 point on 15 point only) can take any of the colours, different colours for alternate characters if you really want!

In combination with a colour printer and colour photocopying, ProWrite can be an effective specialist wordprocessor for the editor/designer of promotional print, children's worksheets (colour is a very effective tool in education), overhead transparencies (depending on the printer again), indeed any presentational material in which text is a vital element.

Of course you can print out from ProWrite in black and white, draft, NLQ or standard. If you wish to print out on a daisywheel then topaz 11 point has to be used to get the correct formatting. Standard here means a graphics printout which reproduces the fonts on screen as well as the italics, bold, subscripts and so on. Colour is nice but it's expensive to deliver on paper.

No Doubt about Graphics

Without qualification I welcome ProWrite's ability to combine graphics and text. ProWrite allows you to cut out a rectangular block of IFF graphics, created in a 'paint' program. This is achieved by opening a second document and loading the graphics. At this stage you are prompted to choose the degree of shading to apply to the graphics, full, partial or none. The choice depends on the picture and the printer. Once 'cut', the graphic appears in the top lefthand corner of the text document in which you 'paste'. You can then move the graphic around the document to wherever it looks best. Text can take on the background colour of the graphic which creates a very impressive feature when printed.

Unlike a program such as GEMwrite, ProWrite lets the text flow around the graphics box, it doesn't have to stop above and below. You can even type into the spaces in the picture.

I have begun to experiment with clip art: dinosaurs in the background of a draft letter to the bank manager; fun things like teddy bears – I suppose it should have been he-men or gobots – on children's stationery. Graphics can also be used to impress. A 3D graph from Aegis Impact! can nicely explain (away) some figures. Even the figures themselves saved as an IFF file (via Zing! or Grabbit!) from Analyse! can be used as a table. Company logos, letterheads and standard artwork can also be created and used over and over. ProWrite allows them to be incorporated into displayed footers or headers.

Standards

ProWrite lets you have a number of documents open at the same time, each in its own window which can be sized or placed in the background or scrolled. Text can be moved or copied between windows. Each layout is controlled by the margins, indents and tabs set on the ruler at the top of the document. Settings apply to individual paragraph blocks (defined as text between presses of the RETURN key). The markers for these blocks can be made visible for editing purposes and a format can be copied between paragraphs blocks.

As you type, ProWrite wraps the text according to the selected format, e.g. justified, centred, double-spaced, etc. ProWrite indicates page breaks as they occur. Footers and headers are entered via a menu option with a number of page numbering styles to choose from. They can be displayed on screen if required and there's an option to turn the header (and footer) off for the title page.

The pull-down menus give a good idea of the more standard features of ProWrite. The search and replace operation is particularly friendly through the use of on/off buttons and check boxes with which you can set the exact search pattern you require. The keyboard shortcuts, the keyboard equivalents of pull-down menu options, some of which are on function keys, are also vital for the regular user.

Summary

I very much enjoyed using ProWrite. Although it does lack a spellchecker and supports only Preferences printers, and you can't print marked sections of a document, only a minimum one page. The £100 plus price tag makes it an unlikely buy for the beginner, which is a shame because ProWrite is very easy to use. ProWrite can achieve the more ambitious print projects you may have in mind, which its rivals cannot. In respect of graphics and colour ProWrite is out on its own, but is it also ahead of its time or your hardware budget?

PHONE FOR NEW RELEASES

Pro Write

The definitive Word Processor for the Amiga. Pro Write can do all the things professional word processors can do, and that have been unavailable for the Amiga until now. features include:

IFF graphics can be included in documents * Large range of fonts available
Mix text and Graphics together in colour * Accented characters
copy text between upto 8 open text windows * and a great deal more...

Prism

Prism is the first graphics programmes on the Amiga that allows you to use the mode "Hold & Modify" allowing you to use 4096 colours on screen at a time! Ideal for touching up those digitized photos!

Starboard

THE Memory board for Amiga. Not only does the starboard have a through connector and come in 512K, 1Mb and 2Mb versions (supplied with or without chip), and can be upgraded, but with the addition of the Multifunction module you can have all these extra features:

68881 (Maths processor) socket * Battery backed clock
"Sticky" RAM (keeps your RAMDisc or programmes when you reset/crash the Amiga) * Parity Logic

Karate Kid II & Goldrunner

Two of the most successful arcade games on the ST are now available on the Amiga.
Karate Kid II is the best karate game on any home computer and the animation is stunning.

Goldrunner is no legend for the speed of its scrolling landscape. Wonderfully detailed back-drops and fantastic sound add up to making this the most challenging, most compulsive game on the Amiga to date!

ONLY DIGI PAINT CAN DO ALL THIS

Get the maximum graphics power from your Amiga. Create stunning, lifelike computer artwork with Digi-Paint, the first full-featured 4096 color (Hold and Modify) paint program. Break the "32 color barrier" and finally realize the potential of your Amiga with Digi-Paint's advanced features:

- 4096 colors on screen simultaneously
- NewTek's exclusive enhanced HAM mode
- Dithered HAM gradient fill
- Full screen effects including double, half size, mirror reverse and more
- Full IFF and Digi-View compatibility
- Use 320x200 or HAM hi-res 320x400 resolutions
- Fat bits Magnify mode
- Rectangle, oval, line and other drawing tools
- 12 different paint modes including blending, tinting and smooth shading
- Full lasso cut and paste with automatic edge blending
- Programmed completely in assembly language for fast, smooth response

Find out why Byte Magazine called Digi-Paint "Remarkable". Available now at your local Amiga dealer or call: 1-800-843-8934.

Digi Paint

Stretch the graphics capability of your Amiga to the full with this up-market arts package.

By Clive Grace

The Amiga is, as everybody knows, a stunning graphics computer; it has enough memory set aside for all but the most demanding of applications and to make life even easier, there are a number of screen 'modes' offering various resolutions and colours suitable for various applications.

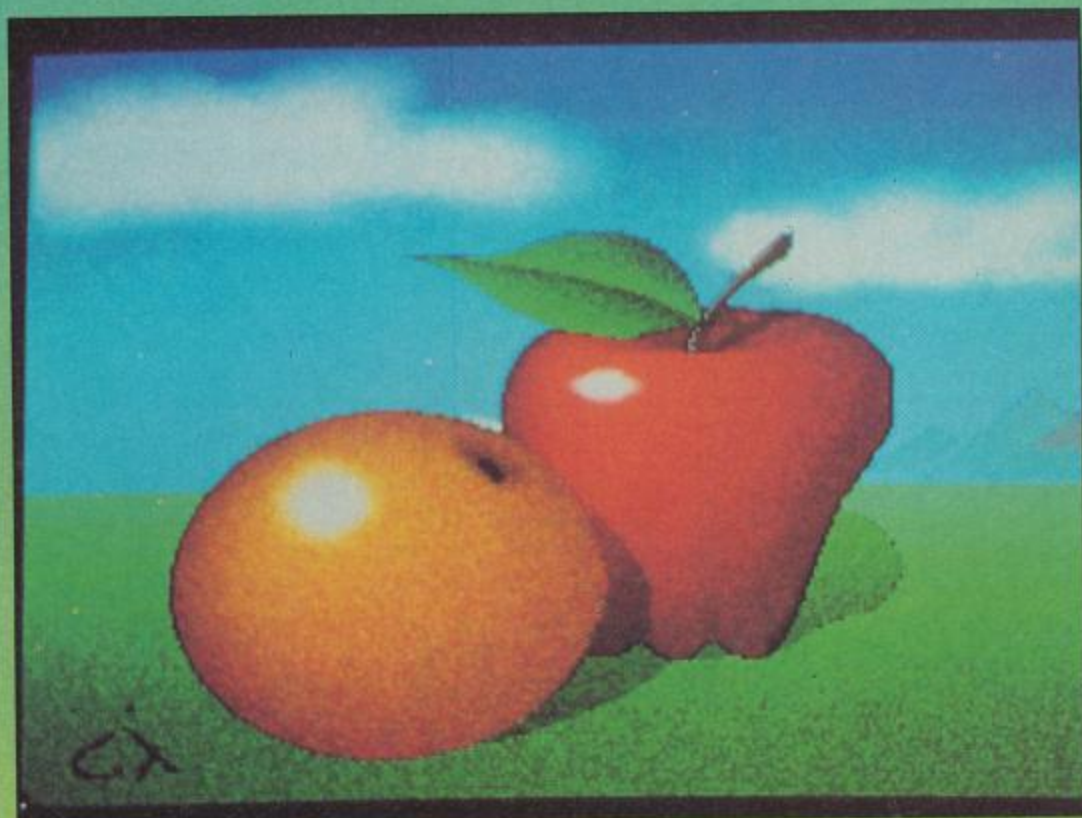

The Amiga can display a maximum of 32 colours, which can be logical colours, or shades of any particular colour, i.e. black and white 'grey scale' colours.

One of the least understood and most underestimated of the screen modes available on the Amiga is the 'hold and modify' video display mode. Initially it was considered something of a curiosity, enabling colour palettes to be shared on the screen at the same time. To the best of my knowledge, no package has yet used this facility to the full.

With the HAM mode, the Amiga can display all of the 4096 colours at the same time, which is no mean feat. And when you consider the many hours that have gone into the programming of this new screen mode, it is amazing that the software was finished at all!

Introducing Digi Paint

Digi Paint is a new software package which is quite frankly, comparable to professional graphics workstations which cost many thousands of pounds. Digi Paint is capable of working in, and displaying, very high resolution pictures using this HAM mode, in both the 320 x 200 and the 320 x 400 resolution modes.

Digi Paint reads standard IFF files, so if you have drawn a picture using any art package, for example Deluxe Paint, or if you have a digitised photograph, you can quite happily load screens in and modify them using Digi Paint. Indeed, New Tek regard Digi Paint as a companion software package to their Digi View video digitiser.

The HAM mode uses six-bit planes to display images, which means that each Pixel uses six bits to determine its colour. If the first two bits are "00" then the remaining four bits are used to determine the pixel's colour, thus giving a choice of a possible sixteen colours from the total of 4096 available.

If the first two bits of a pixel are

"01", then the pixel has the same colour as the pixel to the left; if the bits are "10" then the last four bits (remember they are the ones that determine the pixel's colour) replace the green value, and if the first two bits are "11", then the last four bits replace the blue value.

The effect of all this is that you can display all 4096 colours on the screen at once, although you cannot change from black (red, green and blue all set to "0") to white (red, green and blue all set to "1") immediately. However, such a small limitation is hardly noticeable when using any HAM mode screen.

Naturally, such efficient house-keeping takes a lot of programming, and for the Amiga 500, Digi Paint

requires just about every byte of memory it has to offer, so if you still have a 256K Amiga 1000, now may be the time to think about getting that memory upgrade you have been considering.

Using Digi Paint

The Digi Paint package contains a single disk and a manual and to use it, you simply boot up the disk from the workbench prompt and you are then greeted with the Digi200 and Digi400 icons. You can examine the drawers holding Digi Paint artwork by opening them up. Once opened a miniature of each of the screens is displayed as an icon. This is very useful, especially as you can enter the package by double clicking the icon you wish to edit.

Both the 200 and the 400 resolution programmes have the same screen and menu displays, although the 400 resolution is 'non-interlaced'. Really, you need a slow refresh monitor to stop the screen flickering, however the standard 1081 monitors fare very well while using this mode.

The whole of the screen is used for your artwork, leaving a static window at the bottom, crammed full of options, including brushes of various shapes and sizes, a pair of scissors for cutting out areas for 'brushing' elsewhere on the screen, or for other files, a magnifying glass for really close up work, and a very comprehensive fill option.

Other facilities include being able

to pick a colour from the picture you are drawing on. For example, flesh tones are some of the most complex colours a painter can achieve, but if you are using a digitised colour photograph, these tones are instantly accessible by simply clicking the 'pick colour' icon and moving the arrow to the desired position on the screen.

The ability to take a colour from one picture and move it to another is a very useful feature. Have you ever taken a black and white photograph and later wished it were in colour? Well, with Digi Paint you can simply take the digitised image of the photograph, transfer the colours from another photograph (or even from the colour board on the static screen) and then paint away by using the tint option. The end result can be very effective, especially with old fashioned photographs such as the presidents of America supplied with the 'Butcher' graphics utility disks.

Should you have drawn something that didn't work out as planned, you can 'undo' that portion of the drawing a little like stepping back in time to a point before you committed something to the screen. You can also repeat options by pressing the 'again' icon, enabling you to quickly repeat operations that require complex actions.

Brushing Up The Act

Dithering is a process used by many 8 bit art packages to obtain shades of

colour. For example, by having alternate pixels of red and yellow, a computer can generate an orange of sorts. With the Amiga, even subtler shades of colour can be created using dithers, so that a possible 65000 shades of colour can be obtained, comparable to the total colour capability of a Quantel graphics workstation.

The colouring of black and white pictures has become quite a heated issue in the world of cinematographers, some of whom take offence at the false colouring of old films in order to give them new life and lustre. For black and white photographs however, Digi Paint has some very real applications. For instance, once can experiment with combinations of face make up (assuming you have the right colours to begin with!) or sketch out ideas for interior decoration and clothes design.

For the sheer fun of painting, the computer can be a very expressive tool, but after being so used to the limitations of 8 colours on other art packages for other machines, the choice of colours can be somewhat overwhelming. The mouse is an excellent tool for drawing with, although I have yet to use a graph pad in conjunction with this piece of software.

Custom shapes can be manipulated for added depth and realism. A circle can be drawn with both the 'fill' option and the 'shading' option set, and this will draw a wonderfully hazy circle with concentric circle patterns running around it. By altering the 'dither' slider to make the effects of the dithering less localised, the concentric circles change into fuzzy balls, not dissimilar to Voyager photographs of some of Saturn's moons.

Of all the menus on the screen, the Mode menu is the most useful. Digi Paint modes can be thought of as different paint types. Choosing the correct mode for a particular part of a drawing can be an art form in itself, and they are especially useful if you are merging pictures together.

More importantly perhaps, the mode effects are used to create the many subtle and varied effects possible while using Digi Paint.

The options include drawing when using solid paint, blending, tinting, light tinting, minimum and maximum pasting, as well as the usual Add, Or and XOR (exclusive or) pasting and painting styles available on other packages.

—There are twelve brushes in all, these range from small circles to large diamonds and lines. There are a few basic shapes as well, including either solid or outlined circle and ellipses shapes, rectangles and squares, not to mention the spray can!

For really fine detail drawing, or particularly exacting blending work, the magnifying glass is often useful. This provides a close up image of any portion of the screen and the section you are magnifying is displayed (in real size) in the top right hand corner. You can happily perform most of the standard editing functions while in zoom mode, except for moving the magnifying glass around.

The scissors are used to cut out sections of a picture and move them wholesale to another part of the screen. Technically, this is creating a new brush, and the cut out portion can be saved to a 'brushes' file. Using the scissors with the 'blend' option set in the screen mode area can create some stunning effects, such as adding extra limbs and organs to a body. Interestingly enough, in order to create a mirror image with a brush created by using the scissors, you have to first cut out or load your 'brush' and then reverse the whole screen! Once pasted down, you can, of course, reverse the screen again, but it strikes me as being a little drastic!

Digital Drawings

Digi Paint is an amazingly intuitive art

package; the mouse being very responsive and an excellent artist tool. The interesting thing about this package (other than the stunning range of colours of course) is the way that pictures can be drawn so quickly. My first attempt with the package yielded a complete artists rendition of a strand of DNA, complete with Purine to Pyrimidine cross links!

There are a great many facilities that are suitable for advanced work, such as templating and creating quarter-tones by dithering two shades of colour together. The effect is so subtle that I had to put both colours together before I (or anyone else)

could notice the difference!

The 340 x 400 resolution version of Digi Paint takes up a lot of memory, on a 512K Amiga and this can result in certain functions, such as the magnifying glass and the brushes, being inhibited. However, you can reclaim these functions by moving to the 'preferences' window and clicking off the workbench. Digi Paint does not use the workbench for itself, so it doesn't need to be active while you are using the 340 x 400 package. No problems are encountered when using 1 megabyte Amigas.

Digi Paint is an excellent drawing tool, especially if you are looking for low cost professional art package with high quality outputs – the only problem is finding a printer with a good enough output!

All in all, Digi Paint is an excellent art package. It pushes the Amiga's already impressive graphics capability to its limits, and it is a friendly and powerful package with amazing potential, especially if you are interested in modifying digitised photographs (both colour and black and white), or if you are adapting pictures drawn by other, less powerful packages.

Burning Ambitions

Clarify your knowledge of Eproms and Eprom programming with this handy article.

By Mike Connors

The subject of Eproms & Eprom programming seems now to have stimulated the minds of the average computer user over here in the UK. And not before time. For some considerable time our Dutch and West German counterparts have been whipping the lids off their computers and disk drives for a quick 'chip transplant' on an almost daily basis. Well maybe not quite, but you only have to glance through any German computer magazine and see advertisements for a whole plethora of Eprom programmers, kernel expanders, replacement operating systems and the like to realise that we are missing out on something.

We are obviously much more reticent when it comes to touching the 'tricky bits' let alone removing those screws which lead to the inner sanctum. And yet this shouldn't be the case. After all the C64/128 was actually designed with ROM expansion in mind.

So what's it all about? What kind of Eprom projects can be attempted on the Commodore? These fall into three main types:

Straight forward \$8000 type eprom cartridges.

Replacing internal operating system Roms with alternative or faster operating chips.

More complex 'clever' type cartridges for fastloaders, monitors, etc.

Tools Of The Trade

So what are the basic prerequisites for this mysterious art? Access to an Eprom programmer is an obvious no. 1 on the list if you wish to program or 'burn' your own devices. If you intend to buy your own programmer these are not too expensive nowadays and you can pick up a good one for around £40. Look out for one with a monitor built into the software and make sure that it burns up to 32K devices since these are now the most economical to use.

If you are to experiment with \$8000 cartridges then a universal or configurable cartridge board will make this easy. These boards are available for under £10 and they usually have small DIP switches or links to make the Eprom on board

appear in various places in computer memory. If you have an old game cartridge this could be used after removing the old chip.

For replacing the internal Roms in the computer or drive you will need a conversion or carrier board. This as the name suggests is a simple little device that plugs into the socket from where the Rom has been removed (24 pins) and this in turn accepts a conventional 28 pin Eprom. These usually come with a switch-on board to allow bank switching and again cost less than £10. If you are handy with a soldering iron you could probably knock one of these up using a couple of IC sockets and a switch.

A small supply of 8K, 16K or 32K Eproms are required. Since most Commodore projects will involve replacing one or more 8K blocks we can use the bigger of the devices and use bank switching (more later) to select the banks or pages of the chip.

Eproms come in three main guises. Standard erasable types which can be programmed and then erased by UV light many times. Plastic one time programmable which as the name

CBM80 Autostart Routine

8000	09 80		cartridge cold start vector = \$8009
8002	25 80		cartridge warm start vector = \$8025
8004	C3 C2 CD	38 30	CBM80 Auto Start key letters
			KERNAL RESET ROUTINE
8009	8E 16 DO	STX \$D016	Turn on VIC PAL check.
800C	20 A3 FD	JSR \$FDA3	Initialise CIA chips.
800F	20 50 FD	JSR \$FD50	RAMTAS Clear/test system RAM
8012	20 15 FD	JSR \$FD15	RESTOR Initialise Ram vectors
8015	20 5B FF	JSR \$FF5B	CINT Initialise VIC vectors
8018	58	CLI	Re enable IRQ interrupts
			BASIC RESET ROUTINE
8019	20 53 E4	JSR \$E453	Init BASIC RAM vectors
801C	20 BF E3	JSR \$E3BF	Main BASIC RAM init routine
801F	20 22 E4	JSR \$E422	Power up message
8022	A2 FB	LDX \$FB	
8024	9A	TXS	Reduce stack pointer for BASIC
8025	START YOUR PROGRAM HERE.

suggests can only be burned once. These types are less expensive but are not suited to development work for obvious reasons. They tend to get used for production runs where the program is not likely to need changing. The last main type is the EEprom. This device can be erased electrically, usually with an Eeprom programmer, and re-burned many times. The EEprom is the most expensive type but doesn't require a UV eraser.

Programming an Eeprom

Programming an Eeprom is really a very simple operation. The program designated for your chip is first loaded into memory. This could be from a number of sources: disk, tape, another Eeprom or maybe from another internal Rom in the 64/128. A good Eeprom programmer will allow you to make any changes to the code via its own monitor. When you are ready to program your device first check the type and program voltage. Again the ability to support a range of devices and voltages is standard with a decent programmer. With a suitable blank Eeprom in the programmer, you would usually just press a key and the chip would be burned. This takes less than a minute and the contents of the chip can then be verified against the source program in Ram in just the same way as a save to disk or tape. If all is well you would then either burn another chip or quit.

Conventional \$8000 Or Basic Cartridges

The 64/128 has the ability via its internal PLA to 'see' either an external Rom or internal Ram in an 8K block from \$8000. In addition it will see either internal or external Rom in the BASIC area 8K block from \$A000. What the PLA does is simply controlled by two lines on the cartridge port. These lines GAME and EXROM when grounded will configure the computer in either of the above ways. So if you had a M/C program that ran at \$8000 or A000 then you could burn it into a chip and plug it into a simple cartridge board. By setting the DIP switch or links to ground either or both of the EXROM and GAME lines you have yourself a cartridge based program.

Auto Start Cartridges

The above cartridge would be started by calling it into action. This would involve typing SYS (start address). This would probably be OK but the Commodore has the ability to autostart a cartridge. On power up, one of the first things that the CPU does is look at the first few bytes at \$8000 to see if the letters CBM80 are present. If these bytes are found then the CPU will jump to and execute your cartridge code.

A typical autostart routine is placed in front of your own code in the cartridge.

The above is a sort of

'Housekeeping' routine that does all the things that the computer would have done had it not found the CBM80 bytes. In fact the routine is taken almost directly from the Kernal and Basic system Roms. So now on power up your cartridge would 'Boot in' and, after initialising the system, jump to your program at \$8025.

As you can see, if your program is designed to run in the cartridge area then it is very straight forward. However many programmes including Basic Programmes will not run directly in this way, though you can still get them on to a chip provided of course they are of a suitable size. In these cases you would use the chip as a sort of reservoir which on power up downloaded its contents to the correct place in computer Ram and then jumps to and executes the code. A relocate routine should be tagged on to the end of the autostart program at \$8025.

If you think this might be a bit complicated then the add-on manufactures can come to the rescue. There are Eeprom generator programmes on the market that make your M/C or Basic program and create a file ready for burning onto a chip. All the auto-start and relocate (if required) is done for you. There are also expander boards available that accept up to 8x32K ROMS that can be selected from a menu on power up. As you can imagine it would be very convenient to have your word processor, database or favourite utility available instantly. Again these devices usually have the generator program built in.

Replacing Internal ROMS

There are a number of replacement operating system Roms on the market. These include faster kernals, extended Basics and alternative DOS chips. You may however feel that you don't like a particular aspect of these devices and think you can improve them or you may just want to do something as simple as changing the screen power up message and or colours.

When modifying the kernal one of the main considerations is space since Commodore have already filled the chip with their own code. Most alternative kernals on offer concentrate on fast disk operation and so the extra space is achieved by

removing the cassette routines. This is the most obvious way to make room for your code since this represents about 2K. If more room is needed then the RS232 routines could also be cut down. A full disassembly of the kernels are listed in The Programmers Handbook. The Basic ROM could of course be given a similar treatment.

The internal ROMs are 8K 24 pin devices on the 64 so an adaptor to accept an Eeprom (28 pins) is required. By burning both the existing ROM and the new system with your changes onto a new 16K chip you would then be able to bank through systems at will. Most carrier boards available have this feature indeed some offer the ability to switch through as many as four or eight banks.

Changes to drive DOS chips are for the more experienced but minor changes can be made easily. Again an adaptor board would be required. Some of the earlier parallel Dos systems such as Speedos consisted of no more than replacement Dos/Kernal chips and a cable to link

the computer to the drive. This is perhaps a slightly more complicated area but it is certainly one with many possibilities.

Clever Type Cartridges

These types include external operating systems, monitors and fastloaders. They rely on an Eeprom board that can 'float' in memory. This floating effect is the ability of the software on the board to switch itself in and out of the memory map. This is an obvious advantage for fastloaders and the like which need to load into all parts of computer RAM including the area under themselves and then switch out of the way.

This type of board is different because instead of EXROM line being permanently set, it is controlled by the software/board itself. This affects the PLA as described earlier and you have a 'now you see me now you don't' situation.

Normally this could create a problem of its own since when the

cartridge is switched out, the code to switch it back in has gone. This is where two special lines I/O 1 & 2 come into action. Each of these cartridge port lines enables or decodes a page (256 bytes) at DE00 and DF00 respectively. What this means in simple terms is that you have a page (or two) available that does not go away when the cartridge is switched out. These two pages are rarely used by programmers and so are an ideal place to position the code for strobing the cartridge in and out.

If you have an old fast loader cartridge the chances are that it uses this method. These boards are generally available quite cheaply and offer some very interesting possibilities.

I have touched only briefly on each of the various areas in an attempt to illustrate the possibilities and perhaps whet your appetite. The ability to produce your own Eeproms is certainly an exciting avenue and I hope this article has encouraged you to take those first steps.

YORK ELECTRONIC RESEARCH

Commodore 64/Plus 4 Products

6502 ASSEMBLER 64/Plus 4* tape/disk* £12.99

A sophisticated two-pass symbolic assembler and text editor which supports tape and disk filing. The assembler, the editor, and your source and object code may all be resident in memory simultaneously, facilitating rapid and interactive code development. Recently extended manual with many examples.

Z80 EMULATOR/CROSS-ASSEMBLER 64 only disk £12.99

A unique integrated Z80 development package. The emulator compiles Z80 source code into optimised 6502 which runs on the 64 at approximately one sixth the speed of a 2MHz Z80. It supports all but 20 of the 688 Z80 operations, calls to 6502 routines, and interrupts. The cross assembler generates hex or binary Z80 object files. The disk also contains a powerful editor and several example programs.

BI-DIRECTIONAL RS232 INTERFACE WITH
COMMUNICATIONS SOFTWARE 64 +4* .. tape/disk* £29.99

The 64 KERNAL supports RS232 via the user port. This interface provides the necessary voltage conversion for direct connection to RS232 printers, modems and other devices. It is compatible with Easyscript and Superscript. The unit is supplied with 1 metre of cable (add 75p per extra metre*) terminated in a 25-way male (or female*) D-connector. The software includes a terminal emulator which supports split baud rates and auto-dial, file transfer utilities, a menu driven port initialisation program, and a transparent printer driver which vectors the KERNAL to redirect device 4 printer output to the RS232 port.

*Please specify.

Prices are fully inclusive. Overseas orders add £2.50

BE IN ON THE ACTION . . . FROM THE VERY START

COMMODORE DISK USER is a lot more than just another computer magazine. Every issue carries a diskette containing more than £30 worth of software ranging from serious programming utilities to arcade games. There are plenty of Commodore magazines on the market, but we believe that this is the *first* to cater for disk users of all ages and tastes.

The MEGAVALUE first issue will include on disc:
★ 3 into 1 Plus - A superb all-purpose graphics editor

★ Mobsters - An extremely addictive arcade strategy game

★ Disk Designer - Revamp your disk director, any way you like it.

★ Ski Run - A compulsive 3D winter sports simulation. Break a leg!

... and lots more.

The magazine will include full details of how to use the programs, plus a wealth of reviews and features. This month we interview the US software houses poised to invade the UK, Compunet tells us all its secrets, and you get the chance to win a selection of Microprose software. Plus news, reviews, and our mind-bending puzzle page.

COMMODORE DISK USER is what you have been waiting for - take out a subscription TODAY!

I.Q.

For those of you who like a brain-straining challenge, then look over our intellectual selection of games.

THE CHESSMASTER 2000

All chess programmes, apart from the factual playing of the game, offer various features. Different skill levels, 3-D graphics, joystick control or whatever. To date, it has been very much a case of pick the accessories that you like the best. Now your search is over.

The Chessmaster 2000 has the most comprehensive set of features that I have yet witnessed in a single chess program. Indeed, it is difficult to think of anything that has been left out. As well as the eighteen skill levels plus an indefinite mode, there are special, easy and coffeehouse modes.

You can choose from 2 and 3-D displays, rotate the board, change the colour of the board, alter your method of inputting moves (algebraic or joystick), set up the board to solve specific problems, take back moves, replay a game, ask for all legal moves to be displayed and even ask for a hint!

Partially played games or games that you wish to study later can be saved to disk. The package also includes a second disk containing 100 classic games ranging from the seventeenth century to the 1985 Karpov - Kasparov World Championship.

But these features are really only the icing on the cake. The play's the thing. It is difficult to assess how well a program plays without setting up a series of games against other machines or against a good player.

One of the nice things about a beginner or casual player playing against the computer is that you can set the skill level to be always that little bit better than you are.

Having played against most chess programs at some time or other, I felt that Chessmaster was stomping all over me where other programmes wouldn't have done so. There is no quoted ELO rating for the program but it does boast an opening library of 71,000 moves.

As far as any beginner or non-tournament player is concerned, I would have no hesitation in saying that this was the best chess program currently available both in terms of playing skill and features. And I strongly suspect that all but the very top players would find Chessmaster 2000 a more than useful opponent.

GUILD OF THIEVES

With the release of just one game, The Pawn, Magnetic Scrolls, shot straight to the top as Britain's leading adventure house. Their parser is unequalled and they brought a quality of graphics to the game that made every other graphic adventure look positively prehistoric. Even if the story line didn't quite gel at times, the game was head and shoulders better than anything else written on this side of the Atlantic. The Guild of Thieves is their second release and is

guaranteed to maintain their number one position.

You are an aspiring burglar, but all crime in Kerovnia is controlled by the Guild. If you want to keep any of your ill gotten gains, you will need to become a fully paid up member of the Guild or else risk becoming a permanent fixture at the bottom of the Kerovnian equivalent of the M25.

The Guild however does not let any old riff-raff join. You have to prove your ability first. Your initiation test comes in the form of a large mansion just waiting to be burgled. To make sure that you don't try to pull a fast one, the Guildmaster has cased the joint and knows exactly what goodies lie around the place.

The game is almost a return to the very first adventures, i.e. a treasure hunt but you are never quite sure what is going to be valuable before you store anything in the sage. Items placed there cannot be retrieved again.

The storyline, the weak element in the Pawn, is much improved and the game flows very well with some excellent and original puzzles to be solved.

I have already mentioned the parser as being state of the art but Magnetic Scrolls are never satisfied. One additional touch is that if you have previously examined a location, you can type in 'Goto xxxx' and providing there are no problems in the way, you will travel to your chosen destination via the most direct route. A boon to people who can't be bothered to draw maps.

The graphics are again excellent and have an Impressionist feel to them. You can choose to have either the full picture, a small cameo in the top right hand corner of the screen or even no pictures at all if you prefer text only games.

Superbly packaged with a copy of the latest *What Burglar* magazine, which includes a coded hint section should you get stuck, The Guild of Thieves deserves a place in any adventurer's collection. Highly recommended.

LEGACY OF ANCIENTS

As a poor shepherd living on the planet Tarmalon, you have never strayed far from home - you have never needed to. All that is about to change, when one day you discover a body out in the hills. The dead man is wearing a gold bracelet and carrying a scroll and you feel compelled to take them, even through your first reaction is to run. Curiouser and curiouser, especially when you see a large building in front of you where none stood before.

The building is a museum and you wander round looking at the various exhibits. Most of them require a jewelled coin to access their information. You only have two jade coins at present, but that is enough to start you on your adventure.

The geography of Tarmalon is large and varied. Towns lie dotted around, but the land between them is treacherous, and monsters lurk everywhere. A few will trade with you but most are after your blood. At least, if you defeat them, you can help yourself to the contents of their lair - usually gold!

As you start, so you have little idea of what your quest entails and to make matters worse, you soon have the scroll stolen. The towns are a good source of gossip, especially if you have your fortune told. Here you can also buy weapons and armour, food and magic spells. Healers are plentiful but you need to perform a task before they will help you. Schools allow you to improve some of your attributes, for a fee of course. Money is always in short supply but there are places where you try your hand at a couple of gambling games. It is worth banking any profits too as not only do you earn interest, but your money stays put should you meet an early demise.

There are many smaller quests to complete before you get near your goal. Castles need to be explored and dungeons ransacked. You will need to buy boats and bigger and better weapons before eventually employing the services of a winged messenger to fly you to your final confrontation.

Apart from moving your character, the game is entirely menu-driven. The system works well and is very simple to use - no huge list of different commands to learn. The graphics come in two forms. A top down view for when you are in the wilderness, towns or a castle and a 3-D view in the dungeons and museum. The dungeons especially are accompanied by some excellent graphics for the monsters.

Legacy of Ancients, unlike some role-playing games, is very easy to get into. The plot more or less points you in the right direction as to what you should do next and there is no need for copious note taking. Despite that, it is no pushover and I would estimate some 40-50 hours of gameplay. The ending is also nicely done as your exploits are recorded for posterity as one of the museum displays. Highly recommended to both newcomers and fans of this type of game.

LURKING HORROR

Horror is the name of the game in this latest adventure from Infocom. Written by Dave Lebling, author of Zork, Suspect and Spellbraker, the story oozes atmosphere.

You are trying to finish your last assignment, at GUE Tech. The terminal room is for once nearly deserted, probably due to the mountains of snow outside and the lateness of the hour. The only other occupant of the room is a somewhat rancid hacker, furiously keying into some unintelligible listing.

Logging on, you call your half completed essay but somehow the words have all changed and you find yourself being drawn into another existence as you are called upon to witness a strange occult ceremony.

Returning to the terminal room, the hacker is most impressed by your efforts, especially if you maintain his daily fix of Chinese food. He suggests that there might be some sort of mix up with the Alchemy department and suggests that you pay them a visit.

Due to the snow, getting there is not as easy as it should be. However, there is another way. Secret passages, prohibited to students, are rumoured to lie below the main

buildings, linking them. It seems that you have no choice but to explore the murky depths. Shifting piles of rubbish with a fork-lift truck reveals a trap door. You open it and your nightmare is just about to begin.

This is another typical Infocom game - and that means excellent! Superbly packaged, an excellent parser (although it's beginning to show its age now) and a story that just drips with atmosphere. Lurking Horror is a game that just demands to be played after midnight with all the lights turned out.

G.R.H.

Touchline:

Name: The Lurking Horror. **Supplier:** Infocom/Activision, 23 Pond Street, Hampstead, London NW3 2PN. **Tel:** 01-431 1101. **Machine:** C64 - disk only. **Price:** £24.99. **Originality:** 8/10. **Graphics:** N/A. **Playability:** 9/10. **Value:** 9/10.

THE PAY OFF

Noun/verb adventures strike again but who uses complex parsers that much anyway? The Pay Off is a welcome text-only budget offering, as a taster for those who still haven't experienced the genre and are daunted by Infocom prices.

Boy, are you in trouble! You owe the local bookmaker a cool forty thousand green bucks and all you've got in the world is £50 and a hot tip for the 4.30. How can you pay off Luigi and place your bet in time?

You can try to place a bet with Luigi but his 'boys' eject you without ceremony each time. All roads seem to lead to dead ends until you discover a drainpipe. This leads you on to discover that a fabulously expensive precious stone is due in town. The answer to your prayers is about to fall in your lap and all you have to do is work out where, when and how you can steal the stone.

Although the vocabulary in this adventure is limited to about 100 words, the game is not bounded by small-time thinking. Completing your adventure takes guile and a fair bit of shoe leather. How do you tackle a hidden safe? Short out an electric fence? Sort out a human fence? From sewer to penthouse you have to leave no stone unturned if Luigi is to be placated in time. Cross him and he'll cross you with one of those pretty white marble ones on Boot Hill.

Text-only adventures are making a come back as people realise that a lack of graphics means an excess of complexities within the logic of the game. All that has to be done now is to alert the multiples that the tide is turning and get them to stock the new games.

The Pay Off won't break the bank but it will contort your brain and furrow your brow. Buy it or you'll probably get a call from Luigi!

Plus/4 and C16 Disk Menu

*Find the program you want quickly and easily with this
handy menu.*

By Jeffrey Hoyle

It can be infuriating trying to find the program you require when you have a lot stored on one disk. This program displays all the program files on the disk presently in the disk drive, and places a corresponding letter or number beside the program name. On selecting a program, pressing the relative key will load and automatically run the chosen program file. If the disk menu program is set as the first program in the directory, then it may be loaded and auto-run by pressing SHIFT and RUN/STOP together. The overall result is that this program saves considerable key presses when loading and running programmes from disk.

It should be noted that the program only displays those files on disk, which have the abbreviation 'PRG' after the file name, when directoryed. The other kinds of files cannot be loaded and run, like a program.

Typing In

Type in the program as listed - the REM statements may be omitted. Before running the program, it is essential that you save it, as it overwrites itself. If there are any errors, then they should be noted and corrected after the program has been

reloaded from disk. After the program has been entered correctly and run, there will be a new program sitting at the start of BASIC. When listed, it should read:

```
10 SYS4118
```

The program now has to be saved, as machine code, so it is necessary to go into MONITOR. Type the following:

```
MONITOR
S"DISK MENU HEADER",8,1001,
12B8
```

From now on, the program may be saved and loaded as a BASIC program, which omits any undue complications.

Using the Program

It is best to place the program as the first file on the disk, in which it is to be used. If the disk already has files saved on it, then it is necessary to re-organise the directory, so that a free space is created at the top of the directory. The new program saved to disk, will sit in this place.

The re-organisation may be achieved, by the use of the COPY and SCRATCH commands, e.g. if the first program on disk was called 'OLD', then

```
COPY "OLD" TO "TEMP"
```

would copy the file "OLD" to a file called "TEMP", elsewhere on the disk. A check should be made, by listing the directory, before:

```
SCRATCH "OLD"
RENAME "TEMP" TO "OLD"
```

The result is that "OLD" sits further down the directory, and that a free space at the top, has been created for the disk menu program.

From BASIC, type:
DLOAD "DISK MENU HEADER"
after inserting the relative disk, and then replace the disk onto which the program is to be saved. Type in:
DSAVE "NAME"

where the NAME may be the title of the disk. It is possible to insert the Commodore control and colour codes into the program name string. In the case of the disk menu program, reverse character mode could be used, to highlight the disk name.

I have included some pokes, which enable you to customize the screen colours, etc.

POKE 4124 with the Commodore character colour code, to alter the ink colour.

POKE 4129 to alter the paper colour.
POKE 4134 to alter the border colour.
POKE 4166 to alter the vertical start position, of the menu.

POKE 4170 to alter the horizontal start position, of the menu.

For example, the default is 0 for the horizontal position of the menu.

Poking with 11, centers the first column and is neater if you decide to

have 16 or less programmes on the disk.

When you are satisfied with the colours of your choice, save to the disk, as instructed before.

The program also loads and runs a machine code program, if it has a SYS command, at the start of BASIC. I have found this extremely useful for auto-running games and utility programmes, and provides a more professional system. Since the program can locate a machine code program, in the correct place in memory, a BASIC program which was initially saved to disk with the high resolution graphics area set aside, will not load at the normal start of BASIC – hence the program will not run or list. To enable successful loading and auto-running of this program, it will have to be loaded into the computer using DLOAD, and then saved once again.

TELETEXT

A world of information at your fingertips

The Microtext adaptor turns your C64 or C128 into a sophisticated Teletext Receiver. Giving you full colour display of any of the free pages from Ceefax or Oracle. As well as news and sports results, there is road, rail and air travel information, whats on TV and weather reports. You can get an update on share prices or bargain holidays. And not only does Teletext cater for special interests, like computing, motoring, or gardening, but you'll also find things to do and places to go in your area, prize competitions and even your daily horoscope, plus much much more. It's all free, easy to use and it's all at your fingertips.

A page like a recipe or a weather map may be saved to disc or cassette or even printed out and the manual has examples and shows how to access and use Teletext from your own programs, the ability to use live information like football results, exchange rates or weather conditions, provides possibilities limited only by your imagination.

The adaptor fits neatly on the user port of the Commodore. A lead goes to the 'VIDEO OUT' socket of your video recorder so using your Video as the Tuner for the system.

Just £69.95 inc P&P (Overseas add £2.00)

"I wouldn't hesitate to recommend this to anyone"
— Your Commodore Jun 87

MICROTEXT TUNER NOW AVAILABLE

Our own Tuner has been specially designed to provide the signal that the Adaptor needs, thus eliminating the need for a video recorder. Just plug in an aerial, it tunes itself in (!) and channels are selected from the keyboard. The whole system consists of a Microtext Adaptor, Tuner, Power supply, lead and manual and costs just £114.80 inc P&P (128D version add £8.50) Only from:-

Commodore 128 Preferences

*Predefine your defaults with this time-saving C128
utility.*

by D. Anderson

One of the more useful features provided by some of the WIMP operating systems now being employed on new computers, is the ability to define the default characteristics of your computer, rather than have them dictated to you by the manufacturer. This means that when you turn on your computer, it retrieves a special file from the disk drive which contains all the information necessary to set up the system (e.g. screen colours, cursor type, key repeats etc.). You could do this manually every time, but it is time consuming and will in any event be reset as soon as you press RUN/STOP and RESTORE.

Luckily, the Commodore 128 automatically boots the disk drive at switch on, so it has the ability to load and execute a preferences file, but for this to be really useful it is necessary to be able to direct the computer to reset the characteristics of the computer to those in the preferences file every time RUN/STOP and RESTORE are pressed. This means that if a particular program changes, for example the screen colours, you can reset them to your preferred choice simply by hitting RUN/STOP and RESTORE - which is what this program enables you to do.

Furthermore, whilst dabbling around with the machine, I have managed to correct two minor, but very irritating bugs, the routine for which is included in the preferences

file, so that they should never rear their ugly head again!

The first is the split screen glitch - if you type GRAPHICS 2,1<RETURN> you will see at the junction of the graphics screen and the text screen an unsightly flickering which is intensely annoying, and really can spoil what would otherwise be very professional looking programs. The split screen is handled by the editor interrupt routine which has a vector at location \$314. So, by redirecting this vector to the new interrupt routine, I have been able to correct the bug.

Essentially, the problem of split screen glitches occurs because of an oversight by programmers. Now to explain this, I am afraid that I shall have to get a little technical, but bear with me, as I have tried to simplify it as far as possible. Firstly, you must know that a television picture (such as generated by your computer), is generated by firing electrons in a beam at the screen, which causes it to glow - this beam of electrons moves from left to right, generating each line on the screen (raster lines). In order to program a split screen, the pixel line at which the split is to occur is defined, and the computer causes an interrupt to occur when the beam on the television reaches this line.

Once this has occurred, the IRQ routine is entered and the computer has to determine what has caused the interrupt, since there are several

possible causes. Then, when it is sure the interrupt was for the split screen, it can then change the screen mode for the rest of the screen. However, all the time the computer is deciding what caused the interrupt, the television is still drawing the picture, so by the time the screen mode has changed, the electron beam which draws the television picture, is halfway along the line. Furthermore, the computer does not always change the screen mode at the same time, since its timing can not be 100% precise, and so the position at which the split actually occurs oscillates about - hence a glitch is produced.

Delaying Tactics

Now, good programmers take note of this, and build a delay into their program once the split routine has been entered, so that they can be sure that the change will occur within the border, and so any glitch will not be seen. You might well ask why Commodore did not do this, after all they ought to understand their own machines, should they not? Well, after inspecting the split routine, it seems that they have tried to do it.

But what I suspect has gone wrong, is that the UK operating system is the same as the US one, but the US runs at 60 Hz, and the UK at 50 Hz. This means that there is a difference in

timing on the computer between the two countries, which has not been taken into consideration, and hence the delay is not of the correct length to ensure the glitch is pushed into the border. Cure-change the length of the delay, and the problem is solved.

The second bug is that in some of the early Commodore 128s that were shipped, the Caps-Lock Key did not work with the letter Q. As a result, when this key was depressed, you had to use the SHIFT key to get a capital Q, which was rather inconvenient, especially if you forgot.

The reason for this niggling fault is just one faulty byte in the Kernal ROM. Within the Kernal, there are several tables which define the ASCII code which is to be returned for each key-press - one for normal, Shift, C=, Caps-Lock and the Alt key. Also within the zero-page, are vectors which point to the start of each of these tables. So all that is necessary to fix this bug is to produce a corrected version of the faulty table and redirect the vector towards the new version. This vector, at \$348/\$349, is redirected to the start of the new table.

As I said, there are tables for all the different 'modes' of the keyboard, and they all have vectors. So if you wish, it is quite feasible to redefine the keyboard using the procedure outlined above - just by redirecting the vectors, and replacing the ROM tables. Also, as a result of tinkering with this routine I have noticed that the ALT key can be used to acquire lower case letters whilst the Caps-Lock key is depressed - something not noted by Commodore.

Keeping your Options Open

The program as listed, corrects both of the above mentioned bugs, and also allows you to set the default options, which include:

- 40 column background colour
- 40 column border colour
- 40 column foreground colour
- 40 column cursor flashing, or solid keys to repeat or not
- Type of 80 column cursor (fast, or slow flashing, solid, underlined)
- 80 column background colour
- 80 column foreground colour
- Default to upper or lower case

Enable or disable SHIFT/CBM character set change.

The machine code contains checksums, so if you make a mistake typing in the code, you will be informed of it once the program is executed. The routine resides at \$1300, which is destined to become to the C128 what \$C000 is to the C64 - a special 'safe' section of memory in which routines can be located without fear of being interfered by BASIC. Once the options have been set, the preference file is saved onto the disk, and you are given the option of setting up the boot sector to load the routine when the machine is switched on. If you wish to do so, you will probably need a blank disk. This is because on a used disk, the special section of the disk used for booting, is quite likely to contain a file. In any case, if you do use a used disk and the boot sector is occupied, the program will report this, and not allow you to set it up.

For the cassette users, lines 1110 to 1380 can be omitted. The program can then be loaded and executed at the beginning of every programming session.

The Video Title Shop

A look at one of the latest graphics packages.

By Tony Hetherington

The Video Title Shop is described as a computer and VCR utility which can generate animated introductions to your video tapes. This is obviously useful to those lucky few who own a video camera, but also applies to anybody who records and keeps anything, as well as being a way to produce animated shop window displays.

The Video Title Shop is supplied on disk and is accompanied by a 48 page manual that takes you through the steps of planning your sequence following the programmes Command bar prompts, using micropainter plus to draw your backgrounds, adding text in a variety of font sizes and colours and how to link it all together into a sequence complete with scrolling and fizzle effects. And of course the all important instructions explaining how to connect your computer to your video are also included.

Micro painter plus is a straight forward graphics package to use complete with solid and editable pattern files, so interesting backdrops can quickly be created for your sequences which are then saved to disk. The Video Title Shop can then use these backdrops or canvases and a base for a sequence.

A typical Video Title Shop sequence consists of four or five pages, a couple of backgrounds and one or two special effects. Each page is actually quite a lot bigger than your computer screen so it's easy to create some text that can be scrolled on to the screen. This text can appear in a variety of font sizes and colours and is typed into an object. If you want to mix text colours and sizes then you need a new

object for each style of text, if not then your entire page of text can be a single object.

Once an object is created it can be moved around the page to get the positioning exactly right.

A single page may be enough to announce that the video tape contains the pictures taken at Fred's third birthday, but for other occasions and advertising demos you'll want a series of pages and you'll want to link them together in an interesting way. The Video Title Shop makes this easy.

The number of pages you can have is only limited by the C64's memory but since the final sequence is to be recorded on video tape you can record the whole sequence in two or three sections (naturally the package will work with both VHS and Betamax videos).

As I mentioned earlier you can scroll text across the screen and you can also set up a timed page that will stay on the screen for any set time between 1/3 second and 15 minutes when the sequence continues. My favourite effect is undoubtedly the fizzle in which a new page fizzles over the old one, pixel by pixel until the image is complete.

The Video Title Shop is actually little more than a graphics package with built-in animator (and a few added effects) but it could be just what you've been waiting for.

ROM Blow

Feel the burn as Datel's professional DIY cartridge system.

By Eric Doyle

Datel has recently leapfrogged over other utility manufacturers, putting itself in close competition with Evesham Micros. As their product range increases, Datel is refreshing parts of the Commodore system which users could never reach: the cartridge port.

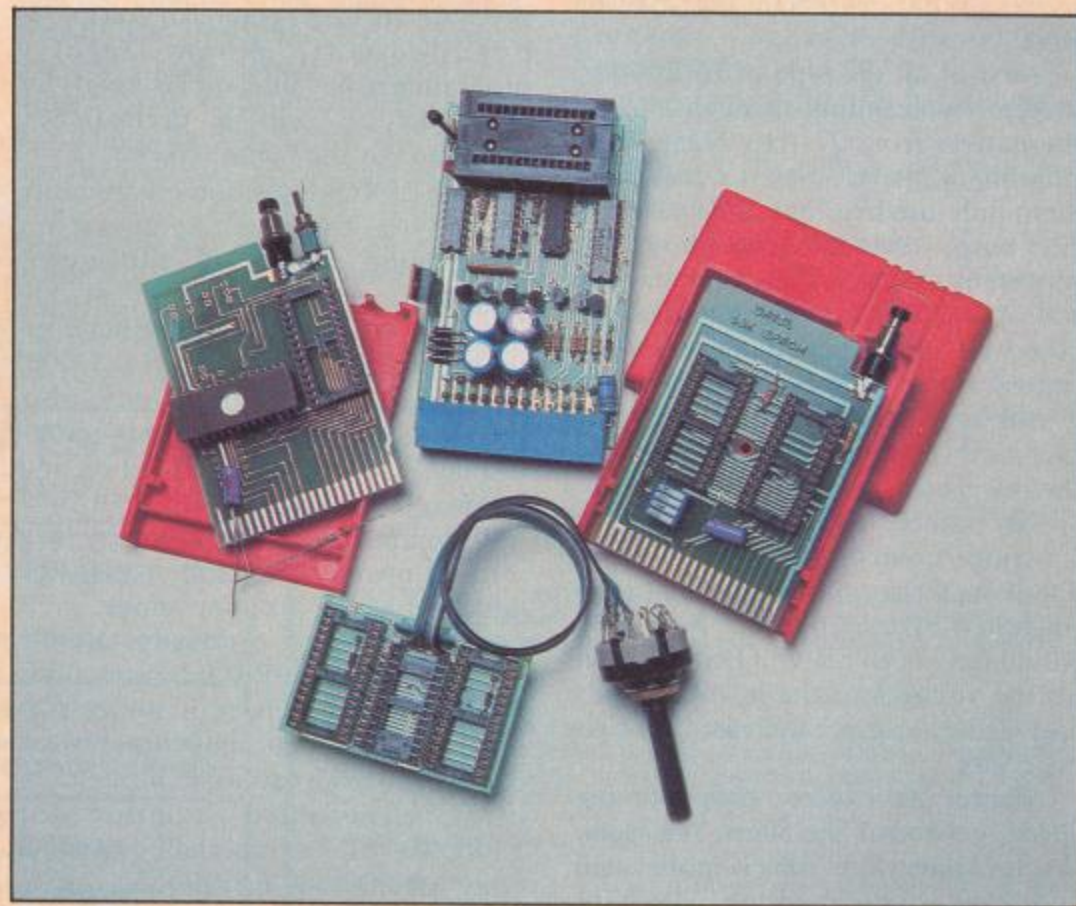

The Datel Eprogrammer's armoury is growing daily but the main elements of their cartridge system are the Eprommer 64, the Cartridge Development System, the 16K EPROM board and Five Way Kernal Expander.

Before assembling a cartridge you need a programmed chip to put into it. EPROMs are identical to the ROMs already inside the C64 in all but one respect, an EPROM can be erased and reprogrammed. Datel's Eprommer 64 is tailored to the C64 and provides all you need to transfer your program from memory to chip.

EPROMs have a code number which reveals their memory size. Most codes start with 27 and the next two or three characters reveal their memory size multiplied by eight. For example, a 2K EPROM would have a value of 8*2 or 16, therefore its code would be 2716, this coding leads to a lot of misleading advertising where 2716 types are referred to as 16K (presumably 16 kilobits), through to 256K chips which are really only 32K.

Eprommer 64 is supplied with its own software which controls the hardware through the user ports. The largest chip which the system can handle is the 27256 (32K) which is equivalent to half of the C64s memory.

Before you start getting too excited about this, let me explain that the maximum space a cartridge system can

access easily is a block of 16K. Furthermore, because the C64 cartridge system is designed to access 8K chips, a 16K chip can only be accessed as two 8K blocks this means that two 8K programmes can be stored in one cartridge. There is also a dual 16K cartridge but I'll come to that later.

Before you can use the Eprommer effectively you have to penetrate the mysteries of one of the worst documented orifices in computer history. Commodore treat their cartridge system like a trade secret and for most owners it is inner space's answer to a Black Hole, we know things go in but the where, how and

why of what happens next form part of the greatest enigma known to man.

Fortunately Datel have unravelled the mystery and their 20 page manual lays bare the inner secrets of the cartridge operating system.

What it boils down to is that the system can be tricked into thinking that your cartridge is a normal part of C64 memory occupying locations \$8000-\$9FFF. When the computer powers up, among other things, it does a test to find if the code CBM80 is stored at location \$8004. This is the autostart key and causes the normal reset routine to abort in favour of the cartridge and a jump is made to a vector pointed to by \$8000-01.

The user program can only run in cartridge space unless a routine is included which will transfer and execute it in normal RAM space.

Obviously, this means a certain number of modification will have to be made to your program before loading up your EPROM. Datel's Epprommer software allows for this by including a monitor as well as the fully comprehensive chip burner.

Blow Keys

Once prepared, the programming of the chip is child's play. The computer displays a menu and using single key presses the parameters for the save can be set.

First of all the type of EPROM is selected by scanning through all five alternatives from 2716 to 27256. This also alters the display to the most commonly used voltage and speed for the burn. Before proceeding it's important to check that the voltage is not too high for the chip you're using, otherwise permanent damage will be caused. If the voltage or speed is wrong it can be changed independently by cycling through the alternatives using the relevant key.

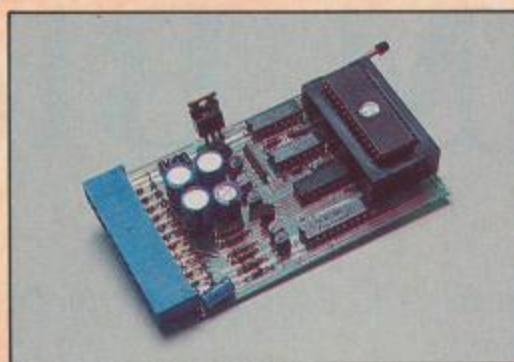

My sample EPROM, part of the Cartridge System kit, was rated at about half the voltage automatically suggested by the program. Perhaps it would have been better if Datel had set all the voltages to the low 12.5 volts and let the user increase this as necessary.

There are three programming speeds between 3 and 50ms, 3ms is too fast for some chips, 4ms is more usual and 50ms is only used for older 2716 and 2732 EPROMs.

Normally the program for transfer will be stored in RAM but occasionally you may want to back up a kernal chip. Selecting ROM using the asterisk key switches in the ROM chip ready for reading.

Today's chips can have such large memories that you may want to program it in 8K blocks. An ALL or RANGE toggle is provided for this purpose. When set to ALL the whole chip will be programmed but on RANGE it depends on which range has been set.

To set a range requires the minimum of thought. All you need to know is where your program starts in memory, its length and where it will

start on the EPROM. Remember that the location of the program in memory at burn time need not bear any relationship to its eventual location in memory at run time, all this is preset under cartridge program control later.

The start and length of the program are easily entered if you know hexadecimal. When Datel's programmer has time on his hands he may like to add a decimal/hex calculator to the menu screen.

The EPROM position is very easily worked out. The first program goes on at location \$000 and subsequent programs normally go on at 8K intervals. 1K is \$400 bytes therefore the second program will start at \$2000.

Several DOS commands also appear on the screen: directory display, disk commands, loading and saving. These are supplemented by a 'fill' command which pokes a zero byte into all memory locations within the limits set as the program range.

The remaining commands are the vitally important EPROM commands. Firstly, you can check if the chip is blank. If not you must follow the correct procedure to wipe the memory using ultra-violet radiation for EPROMs or the specially included erase function for EEPROMs.

The next step is to write your program to the chip (burning) and then verify it against the RAM source.

For those doubting Thomas's who want further convincing, you can also read the EPROM into memory again. This comes in useful when you want to back up a commercial EPROM, suck

the program into memory, and blow it out onto your disk.

A la Cart

Now you have your Epprom you can tackle cartridge production. The Cartridge Development System has a ready to blow 16K EPROM and all the boards and components (all four of them) necessary to set up your board. A reset switch is already fitted next to a switch to allow the selection of which half of the 16K EPROM you are using. The supplied cartridge casing has two cutouts through which the switches will protrude.

Also included in the package is a full 20 page explanation of cartridge theory and assembly. With a minimum of soldering ability, most people will be able to produce professional-looking cartridges.

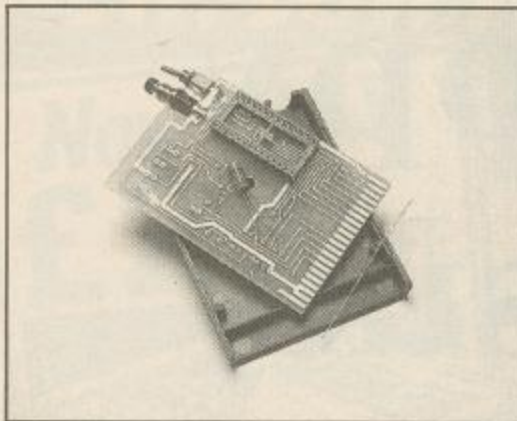

The other cartridge containing the 16K EPROM Board can hold two 27128s which may be switched into memory at \$8000 and \$A000 giving 16K of contiguous RAM (8K from each chip). As with the single chip version the other halves of the two chips can be used to store another 16K program.

The only problems I found with the system were difficulties related to cartridge assembly. Firstly, an experienced programmer may not be very knowledgeable about electronics. To fit a cartridge doesn't require any electrical know-how but it would help if the instructions pointed out the ways to tell which way round a chip should be fitted into the cartridge.

After fitting the chip your problems are not over, the currently fitted DIL sockets which hold the EPROM are too thick. Fitting the two halves of the cartridge together leaves a gap around the edge which, although small, detracts from the professional look of the product.

A final point, concerning the 16K Board only, is that the bank switches on the dual chip cartridge are internal. Everytime the user wants to switch from one program to the other, the cartridge has to be unscrewed, opened, switched and then closed.

With the inclusion of two excellent battery backed-up RAM cartridges (Smart Cart) in Datel's catalogue, the question must be asked: Why bother with burning when Smart Carts are so cheap?

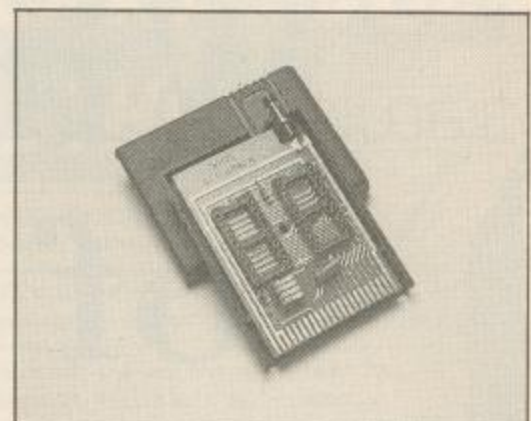

The cost of a Smart Cart is £14.99 for an 8K pack. For a Cartridge Development System the cost is £12.99 but you have the added expense of £39.99 for the Eprommer 64 unit. The difference being that the System cartridge has two 8K programs and you are free of the worries of battery replacement or failure. If you only envisage using two or three cartridges the Smart Cart is good enough. If you can foresee a need for dozens of cartridges and extra Kernal chips then an EPROM system is your only option.

ROM Banking

Datel also has other interesting products which link in with the Eprommer 64. Take the Five Way Kernal Expander for example. Carefully replace your Kernal ROM with a socket and you can plug this board in and refit your ROM. Flanking it on either side is a pair of 16K EPROM sockets which allow you to add four more 8K operating systems. Using the supplied switch to select the chip you want, you can power up into an operating system of your own making.

Each month when I see their adverts, Datel's range seems to have grown. The Eprommer 64, Cartridge System, and Kernal Board are superbly conceived, extremely easy to use and, with 16K EPROMS costing less than a fiver, the cost of producing your own cartridge compares favourably with that of commercially produced ones. With motherboards, Superom boards and cartridges already on Datel's books ask yourself

how much longer you think you can ignore EPROM programming.

Touchline:

Product: Eprommer 64. **Price:** £39.99

Product: Cartridge Development System. **Price:** £12.99

Product: 16K EPROM Board. **Price:** £8.99

Product: 5 Way Kernal Expander. **Price:** £12.99

Address: Datel Electronics, Units 8/9, Dewsbury Road, Fenton Industrial Estate, Fenton, Stoke On Trent. **Tel:** (0872) 273 815.

NEOS MOUSE + SOFTWARE ★ (THE COMMODORE MOUSE) ★

NEOS MOUSE WITH "CHEESE" CASSETTE AND "CHEESE" ON DISC = £34.90

Wigmore disc version includes genuine save and load to disc.

"CHEESE" on disc - £8.50

(including save and load of pictures with fast and slow load.)
Soon available Geos Compatible Mouse - Watch press for details.

ARTIST 64

(For use with Mouse or Joystick)

This is the most sophisticated, powerful and advanced art or graphics package available on a CBM 64 or 128.

"Artist 64 is an excellent graphics package and we were extremely impressed with its range of capabilities. It is in fact probably the most versatile graphics program that we have seen".

Your Commodore takes over where cheese leaves off. Although friendly and fun - can be used professionally with over 250,000 combinations of commands.

★GIVE YOUR 64/128 - AMIGA TYPE GRAPHICS★

Full colour working. Full screen working. Zoom and Pan. Create any brush fill, pattern or icon. Variable Text. Commodore and Epson printdumps. Add other print routines. Innovative colour commands. "Over and Under" - (colours weave over and under each other) "Colour Cycling" "Duplicate objects without certain colours."

P.C.W. "Artist 64 is a compulsory purchase" **Tape or Disc = £29.90**

DESK TOP! (For use with Mouse or Joystick or K Board)

Fascinating Range of utilities handy facilities. 100 year calendar. Diary. Clock. Calculator. Disc Utilities. Name/Addr. Directory.

EDUCATIONAL SOFTWARE

from ADAMSOFT

SHAPING UP WITH NUMBERS: A program suitable for young children - graphics, number handling and shape recognition.
£4.95 on tape or disk.

AN A TO Z OF MATHEMATICS: A 3 part program providing a comprehensive outline of the G.C.S.E. Mathematics required in the first two years of Secondary schooling. Practice your mathematics in a flexible manner.
£9.95 on tape or disk

HIGHER MATHEMATICS: A 7 part, menu driven package covering the complete syllabus for the G.C.S.E. examination. Understand your algebra, geometry, trigonometry, linear programming, statistics and more. Interactive problem solving exercises and a complete examination paper are included.
Available on disk only at £12.95

G.C.S.E. CHEMISTRY: An B part package covering atomic structure, the periodic table, bonding and shapes of molecules. High resolution colour graphics and animation are used throughout with simulated experiments. Interactive problems are provided to test understanding.
Available on disk only at £12.95

VIDEOBASIC-64: All of the above programs were written with the aid of the Videobasic Development Package, the most advanced BASIC extension available for those C64 owners who are fed up of having to use those difficult to remember PEEKS & POKES in order to use the powerful inbuilt graphics and sound capabilities which are ignored by BASIC 2.0. High resolution and multicolour graphics, turtle graphics, sprite handling, sound, memory manipulation, game features and much more are supported by the easy to use commands. A runtime version is provided so that you can sell or give away your programs to other C64 owners. Some VIDEOBASIC routines are incorporated into our CADPAK-64, CHARTPAK-64 and TAS-64 packages. In particular, they share the same screen memory and hardcopy routines, which means that VIDEOBASIC can read in screens produced by any of these programs.
Price: £24.95 on disk only

SPECIAL OFFER: £5 off VIDEOBASIC if purchased with any of above educational packages. £10 off VIDEOBASIC if purchased with any other ADAMSOFT SOFTWARE product as listed below.

Win a Copy of Pegasus

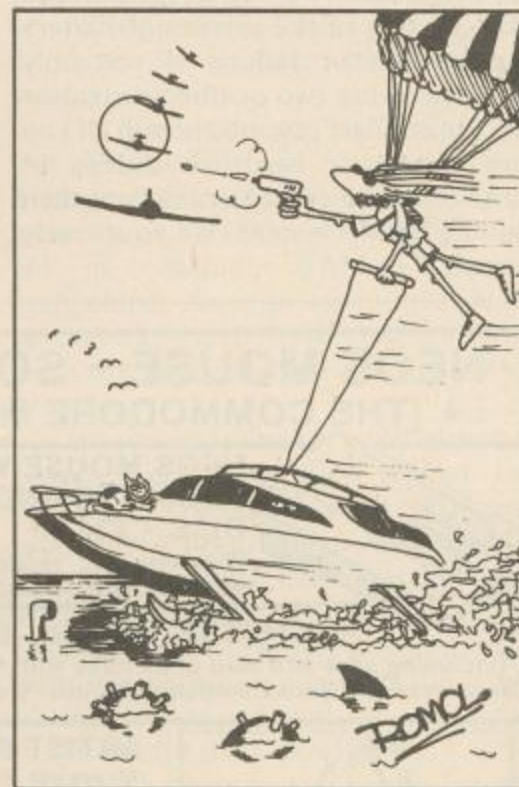

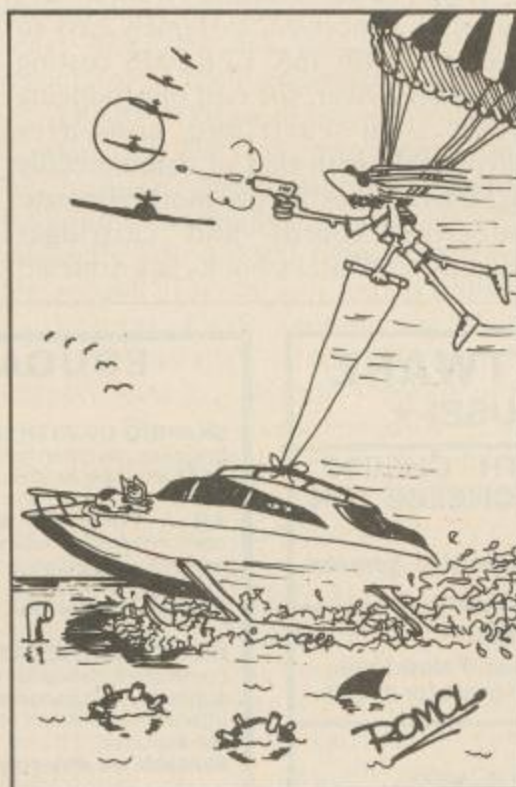

Your chance to glide over the water with one of 30 copies of Pegasus for the C64.

For this month's competition we have teamed up with Electronic Arts to give you the opportunity of trying your hand piloting a hydrofoil by giving you the chance to win one of 30 copies of Pegasus (see review in this issue) that are up for grabs.

PLEASE NOTE - Pegasus is for the Commodore 64 and is DISK only.

How to Enter

Study the two cartoons, there are a number of differences between them. Once you have decided how many differences there are complete the entry coupon and send it to the editorial address (see below). Please write the number of differences that you have found on the back of the envelope. If you don't then your entry will not be accepted.

The Rules

Entries will not be accepted from employees of Argus Specialist Publications and Electronic Arts. This restriction also applies to employees' families and agents of the companies.

The How to Enter section forms part of the rules. The Editor's decision is final and no correspondence will be entered into.

Bulletin Boards

Continuing our computer communications series, this month we look at the various uses of bulletin boards.

By Jennifer Goldsmith

Generally speaking, a bulletin board is an electronic noticeboard, which permits two-way communication. This means that the user can obtain information *and* contribute to the system. It differs from a conferencing system in as much as there are no closed user groups (CUGs) and there are no individual conferences, which are separate entities, with different people organising each conference.

Conferencing systems are usually run by commercial organisations and the subject matter is very diverse. Whereas bulletin boards are usually, but not always, run by the hobbyist and the subject matter is usually specialised in as much as the topics are related to a specific hobby or interest, e.g. PCs, Commodore Computers, Amateur Radio, etc.

How do Bulletin Boards Work

Basically, there are two different ways in which they work. Either you phone

them and when the modem answers, you connect your modem in the appropriate manner for your software, and then you log on. Or, after you phone the bulletin board, you hang up and the bulletin board's modem phones you back. This latter type of logging on is not so common as it is more expensive to implement but it does give greater security. If you go to log on to a bulletin board after having used a commercial system like Prestel, you may find the bulletin board unfriendly.

Exactly what is required differs from system to system but you will find that often your name is required followed by a carriage return or hash. Never, ever, divulge your Prestel ID or password, or any password on any other system (unless everything is free and you have nothing to lose by doing so!).

Some bulletin boards, especially those whose software originated in the USA, operate at 300/300 baud scrolling. However, with the growth in

popularity in the UK of viewdata systems, some software has been written for bulletin boards using this format, i.e. colour and 1200/75 baud. Therefore as mentioned in the October issue, you have to make sure that you have the appropriate software and that the modem and software are compatible.

Growing in Popularity

One of the reasons why bulletin boards have become popular, is that anyone can set them up. For example, a C64 with disk drive, autoanswer modem and bulletin board software for the 64 costing £69, which is available from Y2 Computing, is all you need.

However, many of the popular boards have a hard disk attached. This allows an increase in speed of operation and allows much more material to be available to the user. For example, with a 1541, only a couple of hundred or so frames (in the case of viewdata compatible boards)

could be stored, but with a hard disk, thousands of frames could be stored and/or much telesoftware as well. Therefore, bulletin boards are not only expensive to set up but they are also hard work.

For this reason, you will find that access to some bulletin boards is restricted to certain hours only, yet others are available 24 hours. No-one can give you hard and fast rules when it comes to bulletin boards as there are about 200 in the UK, thousands in the USA, and the number is on the increase.

You may have difficulty in accessing popular boards, as many people are trying simultaneously and there is usually only one phone line, which means of course that only one person can use the system at any given time. You must bear this in mind when you're using a bulletin board, so that you minimise the time you are on-line in order to let others on the system.

Listings of Bulletin Boards

It would be very difficult and impractical for me to provide a complete listing of bulletin boards in the UK. There are various sources for lists, firstly the Bulletin Boards Operators Association, which is an association to which systems operators (sysops) can belong. This information is also supplied to ClubSpot on Prestel. However, these sources of lists are not currently available as unfortunately they were destroyed in a fire, and are in the process of being re-compiled at the moment.

The other source of lists is the magazine Telelink, which comes out six times a year. It is a magazine wholly devoted to communications in the UK and at £15 for two years subscription, it is a MUST. Just contact Database Publications on Prestel MBx 614568383 or on Telecom Gold 72:MAG001 and credit cards are an acceptable means of payment.

Finding Your Way About

There is no easy way of knowing what bulletin boards have what information. Either you get information from your friends and colleagues or you just phone around. Anyway to get you going, here is a brief description of some of them.

However, I can take no responsibility for any errors or omissions.

The first one I would like to mention is a fairly new board, based in Wolverhampton, telephone number 0902 745337. (It may be on PSS but I am not sure.) What is unique, is that (to my knowledge) it is entirely devoted to Commodore users, covering all machines including the Amiga. There is an increasing amount of telesoftware. It is available 24 hours on both 300/300 and 1200/75 scrolling.

The next bulletin board is devoted purely to a hobby. In this case it is Amateur Radio. The Radio Society of Great Britain run a bulletin board (tel: 0707 52242) which is available 24 hours on 1200/75 baud viewdata format. Normally only one phone line is available but I believe it is hoped that two lines will be in use before long.

This bulletin board has a fairly large database on various aspects of amateur radio, including band plans, a diary of events, rallies and contests, information on morse tests and the radio amateurs examination (rae), news from both home and abroad, packet radio, solar propagation, club information and news, RAYNET, repeaters and beacons, books and other products which can be purchased from RSGB, RSGB services, satellites and information for beginners.

In addition to this, there are response frames for ordering books, etc, by credit cards, for obtaining information and you can write your own messages as well. Unlike most boards, it is updated most working days as a full-time editor/database manager is employed.

The Gnome at Home is a very popular board which supports six phone lines 24 hours a day. Two of these phone lines are for the general public, the other four are kept for the paying subscribers. Subscription is very cheap and only costs £1.50 a month which is well worth while, just to be able to access the board more readily. The two lines for the public are on 01-888 8894 at 1200/75 baud, using viewdata compatible software.

The London Underground bulletin Board is available 24 hours on 01-863 0198 on 300/300, 1200/75 and 1200 full duplex and has about 4000 callers a year. This is quite good, but I believe RSGB has between 14-37 callers a day. However, this bulletin board runs on a

PC whereas RSGB's database uses a BBC. Both make use of a hard disk as does the Commodore one which also uses a PC clone.

There are two BABBS boards. BABBS stands for British Apple Bulletin Board System. They run at 300 baud, are sponsored by BASUG, British Apple Systems User Group and are available 24 hours a day on 0394 276306 and 0268 778956.

Robert O'Donnell's bulletin board in Manchester was the first bulletin board to use a BBC micro and colour. Robert has worked for a few computer companies and has even written his own communication software. His board covers most interests, something for everyone - adventure, BBC software, jokes and advertisements. No wonder Micronet are currently employing him!! Rob's board is available 24 hours at 300 baud on 061-427 1596.

Lynn Hurd, who is the sysop for the Communitree Hope bulletin board in Powys, Wales was most probably the first female sysop in the UK. There are currently only about three of four female sysops on the UK (in over 200 boards!).

One important point is that in order to access the board you do NOT have to be using the same computer as the one which is running the board. For example, a BBC may be running the RSGB board but any computer which has viewdata compatible software using 1200/75 will be able to access it.

Accessing Boards in America

The bulletin board industry in America is, unlike its British counterpart, very organised. Most States operate on what is known as Bell frequencies. The UK (CCIT) tones do not work in the USA (and Canada). Therefore your modem will have to be able to cope with the Bell frequencies. The bell frequencies, in Hertz, are: Bell 103 (300 baud) is Originate: transmit 1070 (0) 1270 (1); receive 2025 (0) 2225 (1). Bell 202 (1200 baud) transmit and receive 2200(0) 1200(1).

This is half-duplex and is the same as our 1200 half-duplex. However the 300 baud is not the same as the British 300 baud.

Once you have overcome the problem of the Bell tones, your next problem will be the logging on. As

DRIVER IN THE NEW DIMENSION

It's easy to complain about advertisements. But which ones?

Every week millions of advertisements appear in print, on posters or in the cinema. Most of them comply with the rules contained in the British Code of Advertising Practice.

But some of them break the rules and warrant your complaints. If you're not sure about which ones they are, however, drop us a line and we'll send you an abridged copy of the Advertising Code. Then, if an advertisement bothers you, you'll be justified in bothering us.

The Advertising Standards Authority.
If an advertisement is wrong, we're here to put it right.
ASA Ltd, Dept 2 Brook House, Torrington Place, London WC1E 7HN

Number Tumble

A frustrating game for two players.

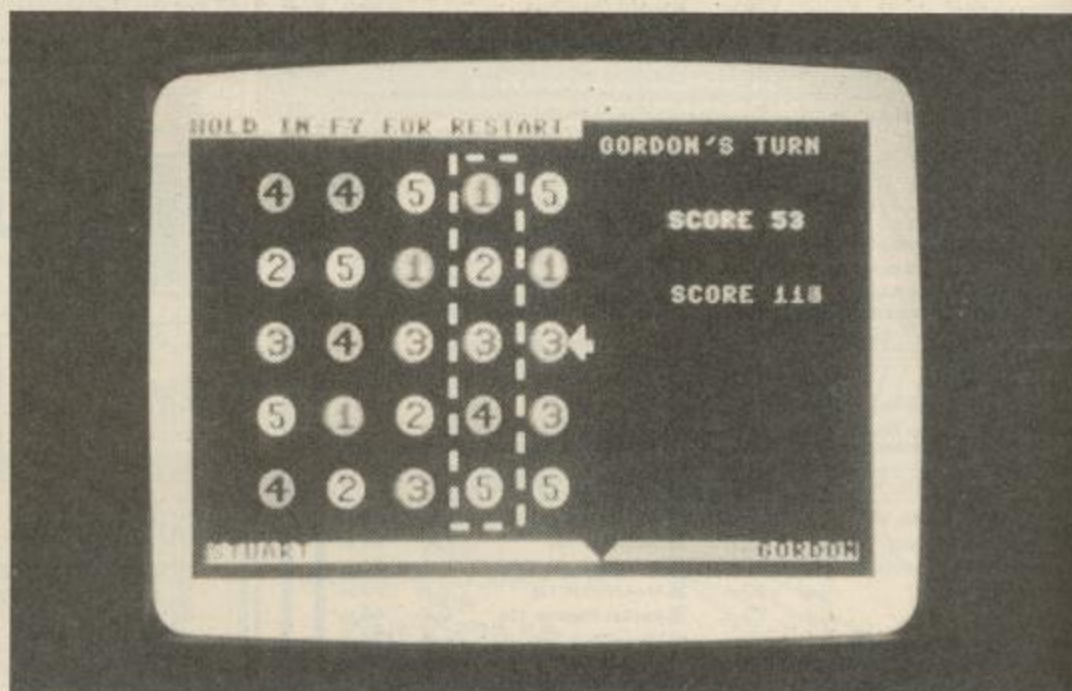

By John Phillips

The basic idea of the game is that a 5x5 grid of numbers between one and five is presented. Player one can move a column one place up or down (with a wraparound effect) to produce either a winning sequence of 1,2,3,4,5 reading up, down, left or right; or to produce scoring sequences of 2,3,4 or 5 identical numbers in a line (up or down). Player two (or C64 if in one player mode) then has to move a row one place backwards or forwards with the same aim.

The winner is the first to produce either a 1,2,3,4,5 sequence or the first to create a large differential in points which will remove the opponents bar marker from the bottom of the screen. Both methods result in a 100 points bonus.

To add to the fun, after all 3, 4 and 5 number scoring sequences, at least two of the numbers are changed by one count in either direction. There are not random changes but they are explained more fully in the program.

In 1 player mode, a pre-selected level of 1 to 5 gives the computer 20% to 100% chance of achieving the highest obtainable score for its turn, but will *always* detect a 1,2,3,4,5 sequence if one is available. The higher the level, the longer the time the computer needs to respond, but this is indicated on screen via a countdown timer.

Other than the random selection of the initial grid the game is totally logical and requires careful thought. Games may last a couple of minutes to half an hour or more, depending on intellect between players or the level selected.

Getting it in

The program is presented in two parts; the first contains all the data for m/c sequences and U.D.Gs and also for copying character sets. The DATA LOADER must be typed and saved

before the Number Tumble program.

A small normalising program has also been given because if RUN/STOP and RESTORE buttons are used after running the main program the screen blanks and no typing can be seen. This is due to the banks, screens and characters having been shifted around.

Type RUN 10000 (even though you can't see it) and the computer will return to normal after RETURN has been pressed. This add-on program proved useful during development of the game and may similarly help while de-bugging takes place.

A Powerful Wordprocessor for the Commodore 128®

Font master 128

Selected
for the 1987
CES Software
Showcase
Award.

From the author of **Fontmaster II** comes **Fontmaster 128**, an enhanced version for the Commodore 128. This powerful word processor with its many different print styles (fonts), turns your dot matrix printer into a more effectual tool. Term papers, newsletters, and foreign languages are just a few of its many applications.

- * Program disk with no protection - uses hardware key
- * Supplement disk includes foreign language fonts
- * 56 Fonts ready to use
- * Font editor/creator included
- * On screen Font preview
- * 80 column only
- * Supports more than 110 printers

Only

£49.95 incl

- * Includes a 102,000 word Spell Checker
- * Insert graphics within text or superimpose text over them & turn this package into a Desk Top Publisher. Clip-Art disk with 110 images £5
- * Send large SAE for more details of our 128 software and the 20/40 megabyte hard disk giving access for up to four 128's on one hard drive.
- * Sole UK importers and distributors are BYTES & PIECES, 37 Cecil Street, Lytham, Lancashire, FY8 5NN.

Software for Sale

If you think that one of our programmes looks very interesting, but you can't afford the time to type it in then our software service will help you out.

It's three o'clock in the morning. You sit at the computer keyboard just finished a marathon typing session entering one of the superb programmes from *Your Commodore*. Your fingers reach for the keyboard and press the letters R, U and N. You press RETURN, sit back and nothing happens.

Everyone has probably faced this problem. When it does happen it's a matter of spending hours searching through the program for any typing mistakes. No matter how long you look or how many people help you, you can usually guarantee that at least one little bug slips through unnoticed.

The *Your Commodore* Software Service makes available all of the programmes from each issue on both cassette and disk at a price of £6.00 for disk and £4.00 for cassette. None of the documentation for the programmes is supplied with the software since it is all available in the relevant magazine. Should you not have the magazine then back issues are available from the following address:

INFONET LTD, 5 River Park Estate, Berkhamsted,
Herts HP4 1HL.
TEL: (0447) 7661/4.

please contact this address for prices and availability.

The Disk

Programmes on the disk will also be supplied as totally working versions, i.e. when possible we will not use Basic Loaders thus making use of the programmes much easier. Unfortunately at the moment we cannot duplicate C16 and Plus/4 cassettes. However programmes for these machines will be available on the disk.

What programmes are available?

At the top of each article you will find a strap containing the article type, C64 Program etc. So that you can see which programmes are available on which format you will also find a couple of symbols after this strap. The symbols have the following meaning:

This symbol means that the program is available on cassette.

These programs are available on disk.

Please Note

Since the programs supplied on cassette are total working versions of the program, we do not put disk-only programmes on tape. There is no sense in placing a program that expects to be reading from disk on to tape. VC

JUNE 1987

- DUAL PROGRAMMING** Have two programmes in your Plus/4's memory at once. (On disk only.)
- EMULATOR 64** - Machine code single stepper for the C64.
- SMART LISTER** - Make your listings smarter and neater with this program. (C64)
- PROCEDURES** - Easier programming for the C64 with this program.
- C64 SOURCE GENERATOR** - A powerful disassembler for the C64.
- LIST ENHANCER** - Improve the LIST command of your C64.
- ANALYSER** - A machine code debugger for the C128.
- ORDER CODE**
- DISK YDJUN87 £6.00**
- TAPE YCJUN87 £4.00**

JULY 1987

- UTILITY COMMANDS** - This provides many vital commands missing from Basic 7.0 on the 128.
- PLUS/4 AND C64 CRUNCHER** - Speed up your programmes with these handy utilities.
- PROGRAMMABLE FUNCTION KEYS** - A utility to make more use of the function keys on the C64.
- DISKIT 5** - A handy routine to convert memory to data statements on the C64. (Disk only.)
- ARCADE ACTION** - Get those sprites with these handy arcade routines on the C64.
- CROSS REFERENCE** - This program helps you sort out your variables on the C64.
- SUICIDE RUN** - A fast and stimulating game for the C64.

ORDER CODE
DISK YDJULY87 £6.00
TAPE YCJULY87 £4.00

AUGUST 1987

DISKIT 6 — Fast file copier for disk users. (C64 - disk only.)

SCREEN MAKER — Design text and low-res graphic screens with ease. (C64).

SCREEN DUMP — A Hi-Res screen dump for the C64 plus MPS801 printer.

NUMBER BASE TUTOR — A C64 educational program helping with tuition of number bases other than 10.

C16 SPRITE — Does your C16 lack something? Then add sprites with this useful utility. For C16 and Plus/4, available on disk only.

WINDOWS — A text window system for the C64.

Order Codes

DISK YDAUG87 £6.00

TAPE YCAUG87 £4.00

SEPTEMBER 1987

DISKIT 7 — Copy your disk programmes to turbo tape with ease. (C64 - disk only.)

PLUS/4 ANIMATED GRAPHICS — High-Res Animation for Plus/4 owners. (Disk only.)

SMOOTH VERTICAL SCROLLER — Professional titling for video owners. (C64)

ORDER CODE

DISK YDSEP87 £6.00

TAPE YCSEP87 £4.00

SPEEDY ASSEMBLER

Your Commodore's own assembler as used in our Byting into the 6510 series, complete with manual.

YSPASSD £9.95.

YSPASSC £9.95.

OCTOBER 1987

Shadow Boxing — Use the memory under the C64's ROMS for storage.

Adventure Kit — The first module of our DIY Adventure system (C64).

Sprite Grabber — Grab Sprites from other programmes and save them for later use (C64)

Hide It — Program protection for C64 owners.

Communications Corner

David Janda is back with more news and views from the communications world.

IN AN UNEXPECTED move, major tariff changes for the Telecom Gold system were made in early August. The good news is that the peak rate time charge is now 6.5p per minute, down from 11p, and that the off-peak rate is now 2p, down from 3.5p. The bad news is that Telecom Gold has imposed a £5 per month subscription fee on every mailbox.

But by far the most controversial change is a new tariff for data transfer. Each block of 512 characters sent to or from Telecom Gold will cost the user 4p at peak time and 1p off-peak – with the first 512 characters free. This means that a 1000 word document will on average cost 48p at peak time or 12p off-peak to read or send.

The new tariff structure will affect all users across the board, especially domestic users as they will not be able to offset the cost of using Telecom Gold as a company expense. Further, domestic users tend to make extensive use of areas on Gold that rely on sending/receiving text such as Email, news areas, and on system 72 which is operated by Microlink – the bulletin board facility.

Almost overnight, the new pricing structure has changed Telecom Gold from being one of the most cost-effective databases, to one of the most expensive. For example, a user wishing to facilitate one of the on-line information services such as Fintech

will have to pay the information provider a time charge for accessing the database as well as the connect charge and the data transfer charge imposed by Telecom Gold. Worse still, users accessing Gold via PSS also have to pay a data transfer charge on top of that. Add to all this the cost of the phone call to your local PSS node/Gold port and the cost begins to add up!

Micronet Goes for Gold

However, there is a way to avoid the £5 subscription fee and the cost of long distance phone calls, and yet still have access to all the facilities of Telecom Gold – by simply joining Micronet.

Interlink is the name of a 'gateway' that enables Micronet subscribers to be connected through to Telecom Gold. From within Micronet, the user goes to the Interlink front page (*401999999 or *INTERLINK) and presses '1' to make the connection. Once this is done, the user logs on by calling system 74, enters their ID and password, and is through to Telecom Gold. Some clever software converts Gold's 80 column format to 40 column that's required by Prestel. At the end of each frame the user is prompted to press RETURN; the screen will then clear and more text, if any, will follow.

To use Interlink, Micronet subscribers must first register online. Once done, you will be provided with your own Telecom Gold mailbox which you can access through Interlink, or by accessing Telecom Gold directly. There is no registration fee and Interlink members do not have to pay the £5 subscription fee each month. There is a charge of 1p per minute for using the gateway, but when you take into account local call access for Prestel/Micronet subscribers and the waiving of the £5 subscription fee, accessing Telecom Gold via Interlink is very cost effective. Consider the following subscription charges for a period of one year:

Telecom Gold:	£60
Prestel:	£26
Micronet/Prestel:	£66

Subscribing to Telecom Gold and Prestel will cost £86 per year, yet subscribing to Micronet (which also means subscribing to Prestel as Micronet is an information provider on the Prestel database) will get you all three services for £66 – and that is exceptional value for money.

According to Micronet's PR manager, David Rosenbaum, Prestel are currently developing on an 80 column gateway which can be used within Prestel/Micronet, and that Micronet have made 'a mega

development in online chat facilities.' Full details on both items next month.

Compunet Changes

SEVERAL MAJOR CHANGES have happened at Compunet over the last few months. First, Compunet has 'moved' the whole database onto their new 'mainframe' computer. Previously, the service was run on a DEC 10 mainframe computer which was a timesharing system. The result was slow logon time, slow page access, slow everything. However, with their new mainframe, which consists of a series of 68020 microprocessors, things should be speeded up. New applications software has been written in C, and single processors are allocated to individual tasks such as updating the directory.

There should be several benefits to the subscriber as a result of the move. Firstly speed – the time taken to move through the database should be improved dramatically. Capacity will be doubled, allowing more people to

subscribe. Facilities such as the multi-user game (MUG) Federation is now available and may soon be followed by Gods. Including MUD, this would bring the number of MUGs to three on the system. Compunet also intend to cater for micros other than the C64/C128 in the near future. The BBC micro was to have been the first of these micros, but the plan to accommodate the Beeb was abandoned earlier this year.

Finally, the cost of using Compunet has gone down – well, sort of. Previously, a subscriber could access Compunet by calling one of several numbers that were scattered around the country. These 'free' numbers have been scrapped and everyone must access the service through the Istel network. Istel prices have gone down to 1p per minute, and the cost of accessing Compunet during peak hours has gone down to 60p per hour for London users and £4 for all other users.

Gold subscribers can take out a quarterly subscription of £3.45 (inc

VAT) to cover off peak connect charges.

Obviously the price reductions are a move in the right direction. But what seems unfair is the removal of the free phone numbers.

Snippit

The cost of accessing Compunet in the evening requires a local phone call to an Istel port during the off-peak period and the Istel charge; the total is £1.04 per hour (ex VAT on the phone call). Accessing Micronet in the evening requires a local call to a Prestel port in the off-peak period; this costs 44p per hour (ex VAT). There is no charge for using the Prestel network.

Touchline:

Telecom Gold: 01-403 6777.

Micronet: 01-278 3134.

Compunet: 01-997 2591.

TURBO-WASHER OFFER FROM A.S.P. READERS SERVICES

**Only
£23.95**

★ NO ELECTRICITY REQUIRED

★ HOSE CONNECTOR & 32oz SOFT SUDS SUPPLIED

Connect Turbo Wash to a garden hose and use its unique telescopic jet with 3 interchangeable nozzles for fine spray, power jet and angle spray to cut through the dirt using controlled detergent dispenser facility and clean water rinse in one continuous operation. Its super dirt cutting blade of water cleans cars, caravans, patios, engines, 'too high to reach windows', lawnmowers, gutters, etc. With no parts to rust the Turbo-Wash will last for years and years.

PSST!

Turbo Wash makes a great Christmas gift.

Adventure Kit II

Continuing our adventure writing series, this month we look at everything you need to know about the text.

By Allen Webb

This month I will deal with the text; the life-blood of adventures. Since text is RAM hungry, this section will utilise the unused RAM lurking behind the ROMs. The actual code is quite small but it needs four tables occupying 1K. In order to print text, we need to know two things. First we need the start address of the text and secondly some way of knowing when the text ends.

In this case, I will use a zero byte as a sentinel to mark the end of each piece of text. Since only simple indexed addressing is used, each block of text is limited to 256 bytes. The actual text is stored in an uncompressed form to allow you the full use of characters and control codes. If you want to use compressed storage, refer to my article in *Your Commodore* (September 1987) which covers it.

How the Code works

Before I describe the editor for this section, I will give some detail on how the code works, for those of you who want to write their own editor. The syntax for the code is:

SYS 51968,BANK,MESSAGE
NO,LINE

Bank refers to the block of RAM concerned and has the values:
0 = area below the BASIC ROM

between 40960 (\$A000) and 49151 (\$BFFF)

1 = area below the Kernal ROM between 57344 (\$E000) and 65535 (\$FFFF)

This gives a total of about 16K for text.

MESSAGE NO is self-explanatory and has the value between 0 and 255. The editor initialises the table values to zero. If you try to call a non-existent message the zero bytes are detected and you get a flashing border to warn you of your error. This action does not, however, terminate execution of your BASIC program.

LINE refers the starting line for the message. The normal scrolling as occurs with PRINT will be invoked.

The memory used by the code is as follows:

\$CB00-\$CBFF...main code
\$CC00-\$CCFF...low byte table for BASIC ROM area

\$CBOO-\$CBFF...main code
\$CCOO-\$CCFF...low byte table for BASIC ROM area

\$CDOO-\$CDFF...high byte table for BASIC ROM area

\$CEOO-\$CEFF...low byte table for KERNAL ROM area

\$CFOO-\$CFFF...high byte table for KERNAL ROM area

The start addresses of each message are kept in the above tables. For example, the low byte (LB) of the start address of message 1 under the BASIC ROM is held in location \$CC01 (52225). Similarly, the high byte (HB) is in \$CD01. The start address of the message is then given by:

Address = HB x 256 + LB

The editor given seems rather disproportionately large for the code it serves, but my reasons for using mostly machine code are simple. Any text editor written in BASIC will be sluggish and the other operations involved will give an unwieldy program. The main editor is called by a short lump of BASIC. It is driven by a main menu screen which also gives help and shows the current memory usage in each bank.

The two memory banks are handled separately and you can only work on one at a time. You can toggle between them by pressing F1, and the border colour will change accordingly. This option is selected from the main menu only. Subsequent actions such as initialisation and text entry act on the current bank.

The Text Editor

The editor screen carries three blocks of information. First, at the top of the screen you are shown the length of the message being typed in. The text buffer shows the actual RAM contents. This allows you to see control codes, etc. This buffer is filled with zero bytes (the '@' characters). Because a zero byte is used as a sentinel, you may not use the character '@' in your text.

The bottom buffer shows how the text will look on screen. This buffer is updated each time a key is pressed. The normal colour and reverse field keys are available so you can get the effect you want. Once RETURN is pressed, the text is stored in RAM. Once this is done, you can't change the message – so beware! When RETURN is pressed, the editor will wait for a key press. Press “-” if you want to return to the main menu or any other key to deal with the next message.

The restriction on editing messages once entered was forced on me if I wanted to keep the code to a

reasonable length. If you work everything out on paper first (as you should) this shouldn't be a limitation.

The saving and loading of text presents slight complications. Since the text is hiding behind ROMs, direct saving and loading was not possible. As it is, cassette users will find it awkward to load to these areas. The MOVER code does this job. It compacts the required text bank into lower memory as follows:

\$5000-\$6FFF.....	text
\$7000-\$7200.....	address tables
\$7201.....	number of messages
\$7202,\$7203....	end address+1 of text

This handy block is easier to save and load. The MOVER code has four entry points:

SYS 49152 . Download BASIC ROM	area
SYS 49155 Upload BASIC ROM	area
SYS 49158 . Download Kernal ROM	area

SYS 49161 Upload Kernal ROM area

You may need to incorporate this code in the loader to your adventure, unless you use a machine code monitor to save code (although this will occupy more than one file).

To use the editor, you must have the following code in memory:

1. The text code.
2. The MOVER code.
3. The Editor code.

If this seems all a bit involved, fear not, I will give a loader at the end of this series which will load all the data blocks for you although, inevitably, this will be separate to your main adventure code. More on that later on.

One last point about the text editor. If you use the RVS ON control code to highlight part of your text, you will note that the whole of your text will be printed in reverse. Fear not, provided that you include a RVS OFF at the required place, all will be well. This is simply a foible of the way the editor works.

See Listings on page 125

POOLSWINNER II

THE ULTIMATE POOLS PREDICTION PROGRAM

- MASSIVE DATABASE** Poolswinner is a sophisticated Pools prediction aid. It comes complete with the largest database available – 22000 matches over 10 years.
- PREDICTS** Not just SCOREDRAWS, but ALWAYS, HOMES and NO SCORES.
- SUCCESSFUL** SELEC guarantee that Poolswinner performs significantly better than chance.
- ADAPTABLE** Probabilities are given on every fixture – choose as many selections as you need for your bet. The precise prediction formula can be set by the user – you can develop and test your own unique method.
- SIMPLE DATA ENTRY** All team names are in the program. Simply type in the reference numbers from the screen. Or use FIXGEN to produce fixture list automatically (see below).
- LEAGUE AND NON-LEAGUE** All English and Scottish League teams are supported, and also the non-league sides often used on pools coupons.
- PRINTER SUPPORT** Full hard copy printout of data if you have a printer.

Boxed, with detailed instruction booklet

PRICE £15.00 (all inclusive)

NOW AVAILABLE

FIXGEN 87/8 AT LAST: No more struggling for hours to get the fixture list into the computer. FIXGEN has been programmed with all English and Scottish League fixtures for 1987/8. Simply type in the date, and the full fixture list is generated in seconds. Fully compatible with Poolswinner. Yearly updates available.

POOLSWINNER with FIXGEN £16.50 (for both)

COURSEWINNER v3

THE PUNTERS COMPUTER PROGRAM

You can develop and test your own unique winning system by adjusting the analysis formula, or use the program in simple mode. Coursewinner V3 uses statistical analysis of major factors including past form, speed ratings, course statistics, prize money, weight, going, trainer and jockey form etc, etc. It outputs most likely winners, good long odds bets, forecasts, tricasts etc. The database includes vital course statistics for all British courses. You can update the database – never goes out of date. **FULL PRINTER SUPPORT.**

PRICE £15.00 (all inclusive) includes Flat AND National Hunt versions.

ALL PROGRAMS AVAILABLE FOR: AMSTRAD CPCs, AMSTRAD PCWs, PC1512, All BBCs, All SPECTRUMS, COMMODORE 64/128

Supplied on tape (automatic conversion to disc) – except PCW and PC1512 (on disc – add £3.00).

Listings

*Get it right first time with our deluxe program system
for the C64.*

You may have noticed that our listings are free of those horrible little black blobs which send you searching around the keyboard for a suitable graphic symbol. You may also have noticed the funny numbers by the side of each line of the listing. Fret no more, it's all part of our easy entry aid.

Instead of those nasty graphics and rows of countless spaces in PRINT statements and strings we use a special coding system. The code, or mnemonic, is always contained in square brackets and you'll soon learn to decipher their meanings.

For example, [SA] would mean type in a Shifted A, or an ace of spades in layman's terms, and [SA10] would mean a row of ten of these symbols.

[S+2] means hold down the shift key and press the plus key twice. It doesn't take a great leap of logic to realise that [C+2] means exactly the same thing except that the Commodore key (bottom left of the keyboard) is held down instead of the shift key.

If more than two spaces appear in a statement then this will be printed as [SPC4] or, exceptionally, [SSPC4]. Translated into English this means press the spacebar four times or in the latter case hold the shift key down while you do it.

A string of special characters could appear as:

[CTRL N, DOWN2, LEFT5, BLUE, F3, C3]

This would be achieved by holding

down the CTRL key as you press N, press the cursor key down twice, the cursor left key five times, press the key marked BLUE while holding down the CTRL key, press the F3 key and, finally hold the Commodore key down while pressing the number two key (C2 would of course make the computer print in brown).

Always remember that you should only have a row of graphics characters on your screen with no square brackets and no commas, unless something like this appears:

[SS].[C*]

In this case the two characters should have a comma between them.

On rare occasions [REV T] will appear in a listing. This is a delete symbol and is created by entering the line up to this mnemonic. Then type a closing quotation mark (SHIFT & 2) and delete it. This gets the computer out of quotes mode. Hold down CTRL and press the number nine key (RVSON), type the relevant number of reversed T's and then hold down CTRL and press zero (RVSOFF). Next type another quotation mark and delete it again. Now finish the line and press RETURN.

A list of these special cases is given in the table but remember that only one of these mnemonics will appear outside of a PRINT string: the symbol for pi. This may appear when its value is needed in a calculation so this may look something like:

:CC=2*[PI]*R:

Ignore the square brackets and just type in a shifted upward pointing arrow (ie. the pi symbol).

Checksum Program

The hexadecimal numbers appearing in a column to the left of the listing should not be typed in with the program. These are merely checksum values and are there to help you get each line right. Don't worry if you don't understand the hexadecimal system, as long as you can compare two characters on the screen with the corresponding two characters in the magazine you can use our line checking program.

Type in the Checksum Program, make sure that you've not made any mistakes and save it to tape or disk

immediately because it will be used with most of the present and future listings appearing in Your Commodore.

At the start of each programming session, load Checksum and run it. The screen will turn brown with yellow characters and each time you type in a line and press the RETURN key a number will appear on the screen in white. This should be the same as the corresponding value in the magazine.

If the two values don't relate to one another, you have not copied the line exactly as printed so go back and check each character carefully. When you find the error simply correct it and

press RETURN again.

If you want to turn off the checker simply type SYS49152 and the screen will return to the familiar blue colours. You can then do whatever it was you wanted to do and if this doesn't use the area where Checksum lies you can go back to it with the same SYS command.

Lower Case

Many of the listings are presented in lower case. To turn your computer to lower case mode press the Commodore key and the SHIFT key at the same time.

YC

Mnemonic Symbol Keypress

[RIGHT]		CRSR left/right
[LEFT]		SHIFT & CRSR left/right
[DOWN]		CRSR up/down

K

OOPS!

Slight changes were made to the listing of our C16 and Plus/4 program REBOUND in the October 1987 issue of the magazine after the text was produced.

The listing was correct in the magazine. There is only one part to it, not two as indicated in the text. This listing should be entered as described using the MONITOR function of the computer.

To use the program you should LOAD it from within the monitor as follows:

L "REBOUND",x,1

where x is 1 if using tape or 8 if using disk. Then enter G1000 to RUN the program.

'Thing' Competition Winners

Are you a winner in the Thing competition from August 1987?

Read on and find out:

Ian Forbes, London; Gordon Masih, Slough; C. Fox, Clwyd; Eileen Liefoghe, Hammerwich; M. Lyon, Plymouth; M. Roberts, Thurmaston; Paul Harris, Tredegar; Henry topham, Keighley; Paul Winstanley, Southampton; K. Williamson, London; Neil Humphries, Barking;

George Bell, Dumbarton; H. Sporle, Didcot; Trevor Cross, Fareham; Steven Holden, Charleston; Andy Clayton, Christchurch; R. Allington, Keyworth; P. Hatton, H.Q. Afcnt; M. Hicken, Ibstock; David MacDonald, Peterborough.

Bug Finder

We'd like to remind our readers that we run a Bug Finder service.

If you have typed in one of our programmes and despite much checking, you still can't get it to run, then send us the following:

Two copies of your program on tape or disk.

A description of your problem.

If possible a listing of your work (you may omit this).

A stamped, self addressed envelope for return of the program to you.

Should any of the above be missing

then we will not be able to deal with your query.

We will try to point out where you have made errors and place a corrected copy of the program back on to your tape or disk before we return it to you.

Do not send a program to us as soon as it stops working, please check it several times first.

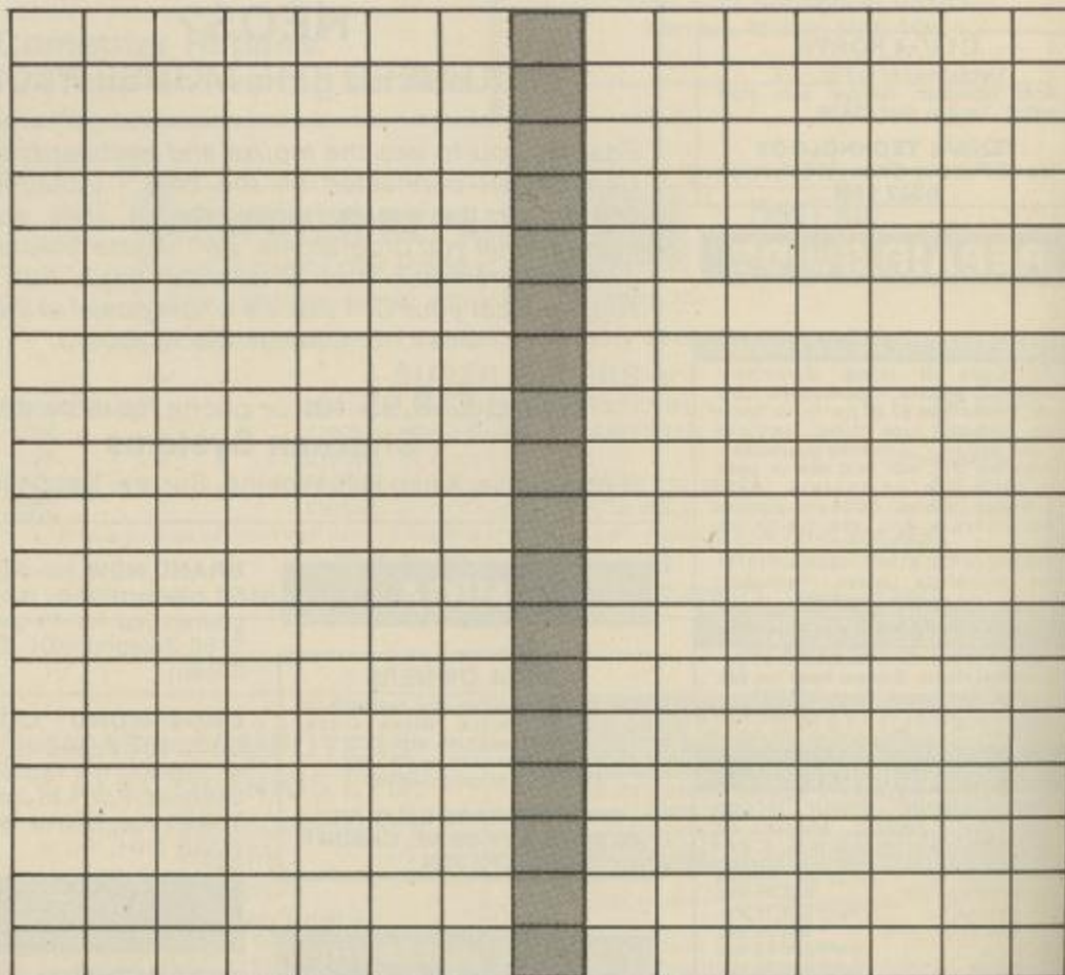

We do get a large number of queries and so it may take a while for us to deal with yours personally.

Note: we can only deal with problems relating to programmes published in *Your Commodore*.

Puzzle

Solve the eighteen clues below and then write the answers, which are all computer related, on the grid in such a way that reading down the central column will give you a phrase associated with computers.

1. Train stops temporary storage area (7)
2. Set of instructions on the box (7)
3. Break in true print (9)
4. Reusable memory from 1000 pointless ropes (5)
5. Language rules sound like VAT in Soho (6)
6. Naval computer? (9)
7. Bloomer goes round print producer (10)
8. Point sorceress on or off (6)
9. Cast tees off for storage device (8)
10. Poem in two thousand about data transmitter (5)
11. Program made few roast (8)
12. Vindicate word alignment (7)
13. Endless foreign friend gets a computer (5)
14. A red tuba produces data transmission frequency (4, 4)
15. Using DDT on number 2? (9)
16. Language hurried after castle (7)

17. Tour in east is part of the program (7)

18. Machine code aide-memoires (9)

The world's only 6 mode intelligent Terminal Unit. Gives excellent performance on PACKET, AMTOR, RTTY, ASCII, CW and FACSIMILE. Transmit, Receive on all modes with tuning indicator and modem circuitry which automatically configures itself for the mode in use. Facsimile printer cable included. Our latest terminal software for the IBM-PC to operate the PK-232 has to be seen to be believed. FAX upgrade kit available for early model PK-232's.

£269.00 + £4.00 P&P & ins. PK-232

Whilst many manufacturers continue to sell clones of the TNC2, A.E.A. has improved on the TNC2 program with several new software features. The Host mode of the new PK-87 Packet Controller can be utilized to improve terminal program operation. Four new commands in the PK-87 allow you to restrict the use of your station for both connects and as a digipeater. The Mailbox monitoring command allows monitoring without displaying the call sign headers. While the PK-87 can be used for HF operation, AEA recommends the optional PM-1 packet modem for low band use. In addition to standard Data Carrier Detect, Push to talk, Status, and Connect indicators, the PK-87 has front panel LEDs for operational mode (Converse, Transparent, Command) and multiple connects.

£169.50 + £3.50 P&P PK-87

A commercial specification, wide temperature range packet radio TNC with the following features: 100% Software Controllable, SMR/Trunked radio operation, Remote Control by radio, Encryption, Macro Keys, Password, Access, Host control language, Modem bypass connector, 2400 radio baud version, Extended temperature range, Protocolless option.

£465.25 + £3.50 P&P PK-90

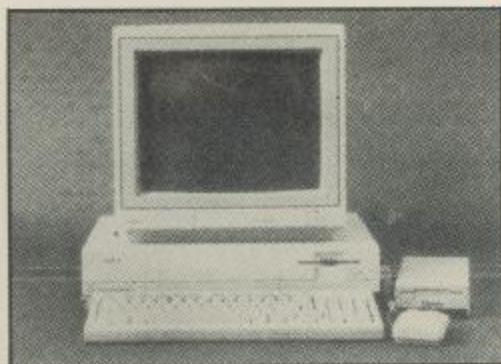

For superbly detailed weather maps from any SSB receiver. Drives any Epson FX-80 compatible dot matrix printer. Double screened, low noise printer cable now supplied as standard. Switchable RTTY receive capability standard. Mobile mounting bracket standard. Marine installation kit and application note available.

£329.95 + £3.50 P&P FAX-1

COMMODORE C64, C128 RS232 INTERFACE

AT LAST!! RS232 Interface that will not cost you the earth
The H&P Computers Commodore RS232 Interface is a full industrial standard RS232 Interface with all handshake lines, that plugs into the user port

Will fit all modems and printers with a 25 way D connector.
Up till now you would have had to pay between £35.00 and £50.00 for a RS232 Interface for the C64/C128.

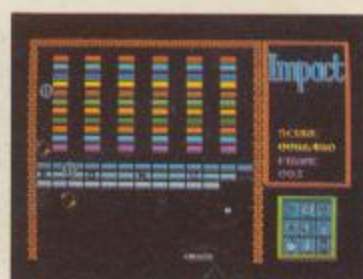

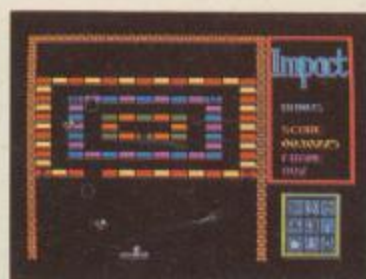

The H&P Computers RS232 is only £25.00 incl. and we even give you an xmodem comms program on disk **free of charge.**

**ONCE AGAIN WE BRING THE BEST FOR LESS.
ONLY £25.00 INCL.**

*It plays like a dream... but seems like a **NIGHTMARE!***

TRAPPED — in a 1970's arcade machine! Every escape route is blocked by a wall of brightly coloured bricks. Powerfully addictive, with 200k of digitized sound, **IMPACT** has 80 built in screens plus 48 that you can design yourself — as hard, as simple, as much fun as you like. Hidden on each screen are special tokens — catch them if you can. Use them to buy one of nine powerful weapons, or keep them until the end of the screen to score a bonus.

Available now, price £14.95 for Amiga (512k min.) and Atari ST (requires 512k, mouse and colour monitor or TV).
Coming soon for CBM64, Spectrum, Amstrad and BBC (specifications vary).

Audiogenic Software Ltd., Winchester House, Canning Road, Wealdstone,
Harrow, Middlesex HA3 7SJ.
